# ELECTROMAGNETISM, ELECTRODYNAMICS DUMP; ELECTRICITY AND MAGNETISM DUMP (INCLUDES NOTES AND SOLUTIONS TO PURCELL'S ELECTRICITY AND MAGNETISM

#### ERNEST YEUNG ERNESTYALUMNI@GMAIL.COM

From the beginning of 2016, I decided to cease all explicit crowdfunding for any of my materials on physics, math. I failed to raise any funds from previous crowdfunding efforts. I decided that if I was going to live in abundance, I must lose a scarcity attitude. I am committed to keeping all of my material **open-sourced**. I give all my stuff for free.

In the beginning of 2017, I received a very generous donation from a reader from Norway who found these notes useful, through PayPal. If you find these notes useful, feel free to donate directly and easily through PayPal, which won't go through a 3rd. party such as indiegogo, kickstarter, patreon. Otherwise, under the open-source MIT license, feel free to copy, edit, paste, make your own versions, share, use as you wish.

ABSTRACT. Electricity and Magnetism notes "dump" - Everything about or involving electricity and magnetism, electrodynamics.

# Part 1. Math

1. Codifferential, The "Vector Potential" and Laplacian

Keywords: codifferential, vector potential, Laplacian

1.1. Codifferential  $\delta$ . For smooth manifold M, dimM = n,

(1) 
$$\delta: \Omega^k(M) \to \Omega^{k-1}(M)$$
$$\delta = (-1)^{n(k+1)+1} * d*$$

For k = 1, 2 cases,

$$\delta = (-1)^{n(1+1)+1} * d* = (-1) * d*$$

$$\delta = (-1)^{n(2+1)+1} * d* = (-1)^{3n+1} * d*$$

Date: 7 mars 2017.

Key words and phrases. Electromagnetism, Electrodynamics, Electricity, Magnetism.

For n = d = 3,

$$\delta: \Omega^2(M) \to \Omega^1(M)$$
  
 $\delta = *\mathbf{d}*$ 

1.2. the "Vector Potential". If B = dA,  $B \in \Omega^2(M)$ ,

$$B = B_{jk}dx^{j} \wedge dx^{k} = \mathbf{d}A = \frac{\partial A_{k}}{\partial x^{j}}dx^{j} \wedge dx^{k}$$
$$B_{jk} = \frac{\partial A_{k}}{\partial x^{j}}$$

So these statements are equivalent:

$$\boxed{B = \mathbf{d}A \iff \mathbf{B} = \operatorname{curl}\mathbf{A}}$$

Indeed, recall the deRham cohomology:

$$H_{\operatorname{deRham}}^k(M) = Z^k(M)/\operatorname{im} d = \frac{Z^k(M)}{d\Omega^{k-1}(M)}$$

1

And so this form for  $B = \mathbf{d}A$  presupposes that

$$B \in [1] = [\mathbf{d}A] \in H^2_{\text{deRham}}(M')$$

But it should be noted on another manifold, this form may not hold; indeed, consider a submanifold or domain  $M' \subseteq M$ . In this case

$$H^2_{\operatorname{deRham}}(M') \ni B$$

## 1.3. Laplacian.

**Definition 1** (Laplacian).

(3) 
$$\Delta: \Omega^k(M) \to \Omega^k(M)$$
$$\Delta = d\delta + \delta d$$

Both recognizing the equivalence between these 2 formulations:

$$*\mathbf{d}*B = \delta B \iff \operatorname{curl} \mathbf{B}$$

and acknowledging that it has to be the case that \*d\*B is the correct expression, coming from d\*F for the electromagnetic 2-form F,

$$\delta B = \delta \mathbf{d} A = \Delta A - \mathbf{d} \delta A$$

Then

$$*\mathbf{d}A = \frac{\sqrt{|\mathbf{g}|}}{(d-2)!} \epsilon_{i_1 i_2 \dots i_{d-2} jk} g^{jj'} g^{kk'} \frac{\partial A_{k'}}{\partial x^{j'}} dx^{i_1} \wedge \dots \wedge dx^{i_{d-2}} = \sqrt{|\mathbf{g}|} \epsilon_{ijk} g^{jj'} g^{kk'} \frac{\partial A_{k'}}{\partial x^{j'}} dx^i$$

Consider the expression

$$\operatorname{curl} \mathbf{B} = \operatorname{curl} (\operatorname{curl} \mathbf{A})$$

I will generalize it and point out its misgivings.

Calculating from definitions for \* and d,

$$\mathbf{d}*\mathbf{d}A = \frac{\epsilon_{i_1i_2...i_{d-2}jk}}{(d-2)!} \frac{\partial}{\partial x^l} \left( \sqrt{|\mathbf{g}|} g^{jj'} g^{kk'} \frac{\partial A_{k'}}{\partial x^{j'}} \right) dx^l \wedge dx^{i_1} \wedge \dots \wedge dx^{i_{d-2}}$$

$$*\mathbf{d}*\mathbf{d}A = \frac{\sqrt{|\mathbf{g}|}}{(d-d(-1))!} \frac{\epsilon_{id'i'_1i'_2...i'_{d-2}}}{(d-2)!} g^{l'l} g^{i'_1i_1} g^{i'_2i_2} \dots g^{i'_{d-2}i_{d-2}} \frac{\partial}{\partial x^l} \left( \sqrt{|\mathbf{g}|} g^{jj'} g^{kk'} \frac{\partial A_{k'}}{\partial x^{j'}} \right) \epsilon_{i_1i_2...i_{d-2}jk} dx^i =$$

$$\xrightarrow{d=3} \sqrt{|\mathbf{g}|} \epsilon_{il'm'} g^{l'l} g^{m'm} \frac{\partial}{\partial x^l} \left( \sqrt{|\mathbf{g}|} g^{jj'} g^{kk'} \frac{\partial A_{k'}}{\partial x^{j'}} \right) \epsilon_{mjk} dx^i$$

In  $\mathbb{R}^3$ ,

$$*\mathbf{d}*\mathbf{d}A \xrightarrow{\mathbb{R}^3} \frac{\partial}{\partial x^j} \left( \frac{\partial A_k}{\partial x^j} \right) - \frac{\partial}{\partial x^k} \left( \frac{\partial A_k}{\partial x^j} \right)$$

At this point, in the "vector calculus" formulation, the partial derivatives in the  $-\frac{\partial}{\partial x^k} \left( \frac{\partial A_k}{\partial x^j} \right)$  would be exchanged in order, and then a so-called "choice of gauge" for  $\nabla \cdot A \equiv \text{div} A$  would be "made," making this term equal 0. As we clearly see above, this If dB = 0, then should not be the case. Rather, this choice should be made:

$$\mathbf{d}\delta A =$$

This is because we should directly use the "manifestly covariant" definition of the Laplacian:

(5) 
$$*\mathbf{d} * \mathbf{d}A = (-1)^{d(1-1)+1} \delta \mathbf{d}A = (-1)^{0+1} \delta \mathbf{d}A = (-1)^1 (\Delta - \mathbf{d}\delta)A$$

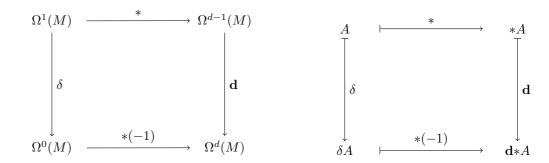

$$\overset{d=3}{\longrightarrow} (-1)(\Delta - \mathbf{d}\delta)A$$

Note that k = 1, i.e. we're dealing with 1-form A here, in the  $(-1)^{d(k-1)+1}$  factor.

So the true expression is this (to reiterate and emphasize the point):

(6) 
$$\delta B = (-1)(\Delta - \mathbf{d}\delta)A$$

Are there any necessary constraints on A to make it, such that  $d\delta A = 0$ ? Perhaps we can take a look at how the definition of the codifferential  $\delta$  necessitates that this diagram commutes:

## Part 2. Maxwell's Equations; My version of Maxwell's Equations

2. My version of Maxwell's equations

2.1. Maxwell's Equations, my version, in "vector calculus" form. If  $\nabla \cdot \mathbf{B} = 0$ , then

(7) 
$$\nabla \times \mathbf{E} = \frac{-1}{c} \left( \frac{\partial \mathbf{B}}{\partial t} \right)$$

If  $\nabla \cdot \mathbf{E} = 4\pi \rho_{\text{total}}$ , then

(8) 
$$\nabla \times \mathbf{B} = \frac{1}{c} \left( \frac{\partial \mathbf{E}}{\partial t} + 4\pi \frac{\partial \mathbf{P}}{\partial t} + 4\pi \mathbf{J}_{\text{free}} + 4\pi c \nabla \times \mathbf{M} \right)$$

2.2. Maxwell's Equations, my version, over spacetime manifold M. For spacetime manifold M, of dimensions  $\dim M = d + 1$ , and for

$$E \in \Omega^1(M)$$
$$B \in \Omega^2(M)$$

(9) 
$$\mathbf{d}E + \frac{\partial B}{\partial t} = 0$$

If  $\delta E = *\mathbf{d}*E = 4\pi \rho_{\text{total}}$ .

(10) 
$$\delta B = *\mathbf{d}*B = \frac{\partial E}{\partial t} + 4\pi \frac{\partial P}{\partial t} + 4\pi J_{\text{free}} + 4\pi c \delta \mathbf{M}$$

with  $\mathbf{M} \in \Omega^2(M)$ , magnetization in matter (i.e. matter magnetization) is necessarily a 2-form.

2.2.1. Some of the algebra (scratch) work/explicit calculations, for Maxwell's Equations, my version, over spacetime manifold 3. Magnetics, macroscopic Magnetic M.

$$dB \Longleftrightarrow \nabla \cdot B$$

since component-wise,

$$\mathbf{d}B = \frac{\partial}{\partial x^k} B_{ij} dx^k \wedge dx^i \wedge dx^j \Longleftrightarrow \nabla \cdot B$$

$$\mathbf{d}E = -\frac{\partial B}{\partial t} \Longleftrightarrow \nabla \times E \equiv \text{curl}E = \frac{-1}{c} \frac{\partial \mathbf{B}}{\partial t}$$

since, component-wise,

$$\mathbf{d}E = \frac{\partial}{\partial x^k} E_i dx^k \wedge dx^i = \frac{\partial}{\partial x^j} E_k dx^j \wedge dx^k = \frac{-\partial}{\partial t} B_{jk} dx^j \wedge dx^k$$

For  $\delta E = *\mathbf{d}*E = 4\pi \rho_{\text{total}}$ , consider

$$*E = \frac{1}{(d-1)!} \sqrt{\mathbf{g}} \epsilon_{i_1 i_2 \dots i_{d-1} j_1} E_j g^{j j_1} e^{i_1} \wedge e^{i_2} \wedge \dots \wedge e^{i_{d-1}} = \frac{1}{2} \sqrt{\mathbf{g}} \epsilon_{ijk} E_{k'} g^{k'k} dx^i \wedge dx^j$$

Further,

$$\mathbf{d}*E = \frac{1}{(d-1)!} \frac{\partial}{\partial x^k} (\sqrt{\mathbf{g}} E_j g^{jj_1}) \epsilon_{i_1 i_2 \dots i_{d-1} j_1} dx^k \wedge dx^{i_1} \wedge dx^{i_2} \wedge \dots \wedge dx^{i_{d-1}} =$$

$$= \frac{1}{(d-1)!} \frac{\partial}{\partial x^k} (\sqrt{\mathbf{g}} E^{j_1}) \epsilon_{i_1 i_2 \dots i_{d-1} j_1} \epsilon^{k i_1 i_2 \dots i_{d-1}} \frac{\text{vol}^d}{\sqrt{|\mathbf{g}|}} =$$

$$= \frac{1}{(d-1)!} \frac{\partial}{\partial x^k} (\sqrt{|\mathbf{g}|} E^{j_1}) \delta^k_{j_1} (d-1)! \frac{\text{vol}^d}{\sqrt{|\mathbf{g}|}} = \frac{1}{\sqrt{|\mathbf{g}|}} \frac{\partial}{\partial x^k} (\sqrt{|\mathbf{g}|} E^k) \text{vol}^d$$

where this (generalized) Kronecker delta relation was used:

$$\frac{1}{p!}\delta^{\mu_1\dots\mu_p}_{\nu_1\dots\nu_p}\delta^{\nu_1\dots\nu_p}\rho_1\dots\rho_p=\delta^{\mu_1\dots\mu_p}_{\rho_1\dots\rho_p}$$

where

$$\delta^{\mu_1\dots\mu_n}_{\nu_1\dots\nu_n} = \epsilon^{\mu_1\dots\mu_n} \epsilon_{\nu_1\dots\nu_n}$$

Note that

$$*1 = \text{vol}$$
  
 $**1 = (-1)^{0(n-0)}1 = 1 = *\text{vol}$ 

and so

$$*\mathbf{d}*E = \delta E = \frac{1}{\sqrt{|\mathbf{g}|}} \frac{\partial}{\partial x^k} (\sqrt{|\mathbf{g}|} E^k)$$

Indeed, we had generalized the divergence, but on a 1-form:

$$\delta: \Omega^{1}(M) \to C^{\infty}(M)$$

$$-\delta E = -\delta(E_{k} dx^{k}) = \frac{1}{\sqrt{|\mathbf{g}|}} \frac{\partial}{\partial x^{k}} (\sqrt{|\mathbf{g}|} E^{k}) \equiv \frac{1}{\sqrt{|\mathbf{g}|}} \frac{\partial}{\partial x^{k}} (\sqrt{|\mathbf{g}|} g^{kk_{1}} E_{k_{1}})$$
(11)

CURRENTS AND FIELD H

Keywords: magnetic permeability, magnetic susceptibility

Suppose we have matter (i.e. the "macroscopic problem", referred to from Jackson (1998), Sec. 5.8 "Macroscopic Equations, Boundary Conditions on B and H", [1]), not a vacuum.

Atoms in matter have electrons,  $e^-$  in orbit, contributing to (rapidly) fluctuating magnetic moments m, along with  $e^-$ 's

Consider an average macroscopic magnetization or magnetic moment density  $\mathbf{M}(\mathbf{x})$  defined in a "vector calculus" manner by Jackson (1998) [1],

$$\mathbf{M}(\mathbf{x}) = \sum_{I} N_{I} \langle \mathbf{m}_{I} \rangle, \qquad I \equiv \text{ index of a particle}$$

Recalling Maxwell's Equations, Eq. 10,

$$\delta B = \frac{\partial E}{\partial t} + 4\pi \frac{\partial P}{\partial t} + 4\pi J_{\text{free}} + 4\pi c \delta \mathbf{M}$$

Consider a time-independent E and negligible P. Then

$$\Longrightarrow \delta B = 4\pi J_{\text{free}} + 4\pi c \delta \mathbf{M}$$

Jackson (1998) [1] considers this magnetization M as contributing to an effective current density by vector calculus arguments of it having a vector potential form, and so he proceeds to write it as (Jackson (1998), Eqn. (5.80) [1])

$$\operatorname{curl} \mathbf{B} = \mu_0 (\mathbf{J} + \operatorname{curl} \mathbf{M}) \tag{SI}$$

Then Jackson defines the macroscopic field **H**, in Jackson (1998), Eqn. (5.81) [1],

$$\mathbf{H} := \frac{1}{\mu_0} \mathbf{B} - \mathbf{M}$$

However, Purcell's treatment is both more lucid, and more grounded in what B field really is physically, less relying upon artificial artifices.

3.1. Free currents J<sub>free</sub> and the field H, magnetic susceptibility. cf. Purcell (1984) [2], Sec. 11.10 Free Currents, and the Field H

Keywords: H, volume magnetic susceptibility

Bound current  $J_{\text{bound}}$  are current associated with molecular or atomic magnetic moments, including the intrinsic magnetic moment of particles with spin.

Free currents  $\mathbf{J}_{\text{free}}$  are ordinary conduction currents.

$$\mathbf{J}_{\text{bound}} = c\nabla \times \mathbf{M}$$

cf. Purcell (1984), Eq. (44) of Ch. 11 [2]

At a surface, where **M** is discontinuous, we have a surface current density  $\mathcal{J}$ . By superposition,

(13) 
$$\nabla \times \mathbf{B} = \frac{4\pi}{c} (\mathbf{J}_{\text{bound}} + \mathbf{J}_{\text{free}}) = \frac{4\pi}{c} \mathbf{J}_{\text{total}}$$

cf. Purcell (1984), Eq. (50) of Ch. 11 [2] Thus,

$$\nabla \times \mathbf{B} = \frac{4\pi}{c} (c\nabla \times \mathbf{M}) + \frac{4\pi}{c} \mathbf{J}_{\text{free}} =$$
$$= \nabla \times (\mathbf{B} - 4\pi \mathbf{M}) = \frac{4\pi}{c} \mathbf{J}_{\text{free}}$$

cf. Purcell (1984), Eq. (51) of Ch. 11 [2]

4 ERNEST YEUNG ERNESTYALUMNI@GMAIL.COM

Purcell also defines

$$\mathbf{H} := \mathbf{B} - 4\pi\mathbf{M}$$

cf. Purcell (1984), Eq. (52) of Ch. 11 [2]; and so

$$\nabla \times \mathbf{H} = \frac{4\pi}{c} \mathbf{J}_{\text{free}} \qquad (cgs) \qquad \qquad \nabla \times \mathbf{H} = \mathbf{J}_{\text{free}} \qquad (SI)$$

cf. Purcell (1984), Eq. (53), (53'), respectively, of Ch. 11 [2].

In magnetic systems, it is precisely the free currents that we can control. So **H** is useful:

(15) 
$$\int_{C} \mathbf{H} \cdot d\mathbf{l} = \frac{4\pi}{c} \int_{S} \mathbf{J}_{\text{free}} \cdot d\mathbf{a} = \frac{4\pi}{c} I_{\text{free}} \qquad (cgs) \qquad \int_{C} \mathbf{H} \cdot d\mathbf{l} = \int_{S} \mathbf{J}_{\text{free}} \cdot d\mathbf{a} = I_{\text{free}} \qquad (SI)$$

where in SI,  $H \sim \frac{\text{amps}}{\text{meter}}$ . cf. Purcell (1984), Eq. (54), (54'), respectively, of Ch. 11 [2].

**B** is the fundamental magnetic field vector; it is only **B** s.t.  $\nabla \cdot \mathbf{B} = 0$  or  $\mathbf{d}B = 0$ 

The basic magnetic field inside matter is **B**, not **H**. That's not a matter of mere definition, but a consequence of the absence of magnetic charges. cf. Purcell (1984)[2].

Now

$$\mathbf{M} = \chi_m \mathbf{H}$$

cf. Purcell (1984), Eq. (56) Ch. 11 [2].

The lines of **H** inside the magnet look just like the lines of **E** inside the polarized cylinder.

- **H** is the fiction of magnetic poles; if there were magnetic poles then **H** is the macroscopic **B** filed inside the material. For any material in which **M** is perpertional to **H**,

(17) 
$$\mathbf{B} = \mathbf{H} + 4\pi \mathbf{M} = (1 + 4\pi \chi_m) \mathbf{H}$$
$$\mu = 1 + 4\pi \chi_m$$

So if there was a linear response between magnetization  $\mathbf{M}$  and the measured macroscopic field  $\mathbf{H}$ , related through the volume magnetic susceptibility,  $\chi_m$ , ( $\mathbf{M} = \chi_m \mathbf{H}$ ), then for  $\delta B = 4\pi J_{\text{free}} + 4\pi c \delta \mathbf{M}$ ,

$$\delta(B - 4\pi cM) = \delta H = \delta \frac{B}{\mu} = 4\pi J_{\text{free}} \Longrightarrow \mathbf{B} = \mu 4\pi J_{\text{free}}$$

and so we have the usual expression (make the comparison)

$$\operatorname{curl} \mathbf{B} = \mu 4\pi \mathbf{J}_{\text{free}}$$

Obtaining an integral form,

$$*\delta B = **\mathbf{d}*B = (-1)^{2(d-2)}\mathbf{d}*B = \mu 4\pi * J_{\text{free}} \xrightarrow{\int_S} \mathbf{d}*B = \int_{\partial S} *B = \mu 4\pi \int_S * J_{\text{free}}$$

Jackson seems to imply to treat macroscopic field  $\mathbf{H}$  as what you measure, since  $\mathbf{J}_{\text{free}}$  is what one can measure and control pointed out sagely by Purcell. So consider this, as I write down an integral form,

$$*\delta H = \mathbf{d}*H = 4\pi*J_{\text{free}} \xrightarrow{\int_S} \int_S \mathbf{d}*H = \int_{\partial S} *H = 4\pi \int_S *J_{\text{free}}$$

If, over S,  $\mathbf{J}_{\text{free}}$  is uniform,  $\frac{4\pi}{c} \int_{S} *\mathbf{J}_{\text{free}} = \frac{4\pi}{c} I_{\text{free}}$ . If we can measure the current, we can obtain the line integral of  $\mathbf{H}$ . But we should really be aware that what we're really measuring is  $B - 4\pi c\mathbf{M}$  - would it be possible to measure the macroscopic  $\mathbf{M}$  To ensure that the differential geometry itself?

#### 4. Eddy Currents

I build upon the physical setup proposed by Jackson (1998) [1] in Section 5.18 "Quasi-Static Magnetic Fields in Conductors; Eddy Currents: Magnetic Diffusion."

For a system (with characteristic) length L, L being small,

compared to electromagnetic wavelength associated with dominant time scale of problem T,

$$\begin{split} f := \frac{1}{T}; \quad \omega = 2\pi f; \quad \omega \lambda = c \Longrightarrow \lambda = \frac{c}{\omega} = \frac{c}{2\pi f} = \frac{Tc}{2\pi} \\ \frac{L}{\lambda} = \frac{LTc}{2\pi} \gg 1 \end{split}$$

From Maxwell's equations, in particular, Faraday's Law, and in its integral form (over 2-dim. closed surface S),

18) 
$$\mathbf{d}E + \frac{\partial}{\partial t}B = 0 \text{ or } -\mathbf{d}E = \frac{\partial B}{\partial t} \xrightarrow{\int_{S}} \int_{S} \frac{\partial B}{\partial t} = -\int_{S} \mathbf{d}E = -\int_{\partial S} E$$

So on S, changing magnetic flux  $\int \frac{\partial B}{\partial t}$  results in E field, circulating around boundary of S,  $\partial S$ .

We know that in a conductor, free conducting electrons get pushed around by E fields, result in a current density J. J is related to E, empirically (by Ohm's Law)

$$J = \sigma E$$

where  $\sigma$  is the resistivity.

Then use the force law on this induced current J from the B field set up:

$$F_{\rm net} = \frac{1}{c} \int_{S} J \times B dA$$

By working through the right-hand rule,  $F_{\text{net}}$  the force on those currents induced in the conductor due to the B that's there, is in the direction to help oppose changing (increasing or decreasing  $\frac{\partial B}{\partial t}$ ).

To find B, suppose B = dA, i.e.  $B \in H^2_{deRham}(M)$ , i.e. B = curlA. For sure,

$$\delta(B - 4\pi c\mathbf{M}) = 4\pi J \iff \operatorname{curl}(B - 4\pi c\mathbf{M}) = \operatorname{curl}H = 4\pi J$$

Be warned now that the relation  $B = \mu H$  may not be valid on all domains of interest;  $\mu$  could even be a tensor! (e.g.  $B_{ij} = \mu_{ij}^{kl} H_{kl}$ ). However, both Jackson (1998) [1] in Sec. 5.18 Quasi-Static Magnetic Fields in Conductors; Eddy Currents; Magnetic Diffusion, pp. 219, and Smythe (1968), Ch. X (his Ch. 10), pp. 368 [5], continues on as if this relation is linear:  $B = \mu H$ .

Nevertheless, as we want to find B by finding its "vector potential" A, we obtain a diffusion equation:

$$-\delta B = *\mathbf{d} * \mathbf{d}A = (-1)\delta \mathbf{d}A = (-1)(\Delta - \mathbf{d}\delta)A \xrightarrow{\mathbf{d}\delta A = 0} -\Delta A =$$

$$= 4\pi\mu J = 4\pi\mu\sigma E = 4\pi\mu\sigma \left(-\frac{\partial A}{\partial t}\right)$$

$$\Longrightarrow \Delta A = 4\pi\mu\sigma \frac{\partial A}{\partial t}$$

where in the first 2 steps (equalities),  $-\delta B = *\mathbf{d} * \mathbf{d} A = (-1)\delta \mathbf{d} A$  it's interesting to note that the codifferential  $\delta$  for the 2 form B had to be written out explicitly, and then the codifferential for the 1-form A is different from the  $\delta$  for B by a(n important) factor of (-1); where  $\mathbf{d}\delta A = 0$  must be satisfied by the form A takes; and where, since  $B = \mathbf{d} A$ ,

(20) 
$$\mathbf{d}E + \frac{\partial B}{\partial t} = \mathbf{d}E + \frac{\partial}{\partial t}\mathbf{d}A = \mathbf{d}\left(E + \frac{\partial A}{\partial t}\right) = 0 \Longrightarrow E = -\frac{\partial A}{\partial t} + \operatorname{grad}\Phi \xrightarrow{\Phi = \operatorname{constant}} E = -\frac{\partial A}{\partial t}$$

whereas a choice of gauge for E was chosen so that  $\Phi = \text{constant}$  (and so a particular form for E was chosen, amongst those in the *same* equivalence class of  $H^1_{\text{deBham}}(M)$ .

To ensure that the differential geometry formulation is in agreement with the practical vector calculus formulation, compare Eq. 19 with Eq. (5.160) of Jackson (1998) [1] and Eq. (10) in Sec. 10.00 of Smythe (1968) [5].

To summarize what's going on, I think one should at least understand in one's head how Maxwell's Equations apply, (and I will try to write in SI here)

(21) 
$$\int_{S} \frac{\partial \mathbf{B}}{\partial t} dA = -\oint \mathbf{E} \cdot d\mathbf{s} \Longrightarrow \mathbf{J} = \sigma \mathbf{E} \Longrightarrow \mathbf{F}_{\text{net}} = \int_{S} \mathbf{J} \times \mathbf{B} dA$$
to find  $\mathbf{B} = ?$  using form  $\mathbf{B} = \nabla \times \mathbf{A}$ ,
$$\nabla^{2} \mathbf{A} = \mu \sigma \frac{\partial \mathbf{A}}{\partial t} \qquad (SI)$$

where, a change in magnetic flux over a surface S over the conductor,  $\int_S \frac{\partial \mathbf{B}}{\partial t} dA$  induces a circulation of E field around S,  $-\oint \mathbf{E} \cdot d\mathbf{s}$ , and this E field is pushing around *free conducting charges* according to Ohm's law,  $\mathbf{J} = \sigma \mathbf{E}$ , with  $\sigma$  being the conductivity of the conducting material, and this current density  $\mathbf{J}$  is then acted upon by the prevailing B field, according to the usual force law. To find  $\mathbf{B}$ , one can find  $\mathbf{A}$  and try to find  $\mathbf{A}$  analytically.

Keep in mind that for  $\nabla^2 \mathbf{A} = \mu \sigma \frac{\partial \mathbf{A}}{\partial t}$ , we had used, critically, the Maxwell equation  $\nabla \times \mathbf{H} = \mathbf{J}$ , with  $\mathbf{J}$  being the *induced* current of free conducting charges on the conductor. This  $\mathbf{H}$  will contribute (through linear superposition) to the  $\mathbf{B}$  that could already be there due to the permanent magnet.
