THE ALGEBRAIC GEOMETRY ALGEBRAIC TOPOLOGY DUMP

ERNEST YEUNG ERNESTYALUMNI@GMAIL.COM

From the beginning of 2016, I decided to cease all explicit crowdfunding for any of my materials on physics, math. I failed to raise *any* funds from previous crowdfunding efforts. I decided that if I was going to live in *abundance*, I must lose a scarcity attitude. I am committed to keeping all of my material **open-sourced**. I give all my stuff *for free*.

In the beginning of 2017, I received a very generous donation from a reader from Norway who found these notes useful, through *PayPal*. If you find these notes useful, feel free to donate directly and easily through PayPal, which won't go through a 3rd. party such as indiegogo, kickstarter, patreon. Otherwise, under the *open-source MIT license*, feel free to copy, edit, paste, make your own versions, share, use as you wish.

CONTENTS

ABSTRACT. Everything about Algebraic Geometry, Algebraic Topology

Part 1. **Algebra; Groups, Rings, R-Modules, Categories**

We should know some algebra. I will follow mostly Rotman (2010) [11].

ERNEST YEUNG ERNESTYALUMNI@GMAIL.COM

1. Prime numbers, GCD (greatest common denominator), integers, Euler's totient, Chinese Remainder Theorem, integer divison, modulus, remainders; Euclid's Lemma

Definition 1 (natural numbers $\mathbb{N}$). *natural numbers* $\mathbb{N}$

$$(1) \qquad \mathbb{N} = \{ \ integers \ n | n \geq 0 \}$$

i.e. $\mathbb{N}$ is set of all nonnegative integers.

Definition 2 (prime). *natural number p is **prime** if $p \geq 2$, and $\nexists$ factorization $p = ab$, where $a < p$, $b < p$ are natural numbers.*

Definition 3. $a, b \in \mathbb{Z}$ **relatively prime** *if* $\gcd(a,b) = 1$

Axiom 1. Least Integer Axiom $\exists$ *smallest integer in every* $C \subset \mathbb{N}$, $C \neq \emptyset$

cf. pp. 1, Ch. 1 Things Past of Rotman (2010) [11]

Theorem 1 (**Division Algorithm**). $\forall a, b \in \mathbb{Z}$, $a \neq 0$, $\exists ! \ q, r \in \mathbb{Z}$ s.t.
$$b = qa + r \ and \ 0 \leq r < |a|$$

Proof. Consider $n \in \mathbb{Z}$, $b - na \in \mathbb{Z}$
Let $C = \{b - na | n \in \mathbb{Z}\} \bigcap \mathbb{N}$.
$C \neq \emptyset$ (otherwise, consider $b - na < 0$, $b < na$, then contradiction)
By Least Integer Axiom, $\exists$ smallest $r \in C$, $r = b - na$.
   define $q = n$ when $r = b - na$.
Suppose

$qa + r = q'a + r'$
$(q - q')a = r' - r$,
$|(q - q')a| = |r' - r|$

   $0 \leq r' < |a|$. Now $0 \leq |r' - r| < |a|$
   if $|q - q'| \neq 0$, $|(q - q')a| \geq |a|$
$$\implies q = q', r = r'$$

Conclude both sides are 0 (by contradiction)   □

cf. pp. 2, Thm. 1.4, Ch. 1 Things Past of Rotman (2010) [11]

Definition 4 (divisor). $a, b \in \mathbb{Z}$, a **divisor** *of b if $\exists d \in \mathbb{Z}$ s.t. $b = ad$.*
a **divides** b *or b multiple of a, denote*
$$a | b$$
$a|b$ *iff b has remainder $r = 0$ after dividing by a*

cf. pp. 3, Ch. 1 Things Past of Rotman (2010) [11]

1.1. Greatest Common Denominator (GCD); Euclid's Lemma.

Definition 5 (common divisor). **common divisor** *of integers a and b, is integer c, s.t. $c|a$ and $c|b$.*
   greatest common divisor *or **gcd** of a and b, denoted $(a,b) \equiv \gcd(a,b)$ defined by*
$$(a,b) \equiv \gcd(a,b) = \begin{cases} 0 & if \ a = 0 = b \\ & the \ largest \ common \ divisor \ of \ a \ and \ b \ otherwise \end{cases}$$

cf. pp. 3, Ch. 1 Things Past of Rotman (2010) [11]

Theorem 2. *If $a, b \in \mathbb{Z}$, then $\gcd(a,b) \equiv (a,b) = d$ is linear combination of a and b, i.e. $\exists s, t \in \mathbb{Z}$ s.t.*
$$(2) \qquad d = sa + tb$$

cf. pp.4, Thm. 1.7, Ch. 1 Things Past of Rotman (2010) [11]

Proof. Let $I :=$
$$I := \{sa + tb | s, t \in \mathbb{Z}\}$$
If $I \neq \{0\}$, let d be smallest positive integer in I.
$d \in I$, so $d = sa + tb$ for some $s, t \in \mathbb{Z}$.
   Claim: $I = (d) \equiv \{kd | k \in \mathbb{Z}\}$ = set of all multiples of d.
   Clearly $(d) \subseteq I$, since $kd = k(sa + tb) = (ks)a + (kt)b \in I$.
   Let $c \in I$.
   By division algorithm, $c = qd + r$, $0 \leq r < d$
$$r = c - qd = s'a + t'b - qsa - qtb = (s' - sq)a + (t' - qt)b \in I$$
If $r \in I$, but $r < d$, contradiction that $\min\limits_{\substack{i \in I \\ i > 0}} i = d$.
   So $r = 0$, and $d|c = c/d$.
$$c \in (d), \ so \ I \subseteq (d) \implies I = (d)$$
       □

Theorem 3 (**Euclid's Lemma**; 1.10 of Rotman (2010) [11]). *If p prime and $p|ab$, then $p|a$ or $p|b$.*
   More generally,
   if prime p divides product $a_1 a_2 \ldots a_n$,
   then it must divide at least 1 of the factors a_i.
      i.e. (notation),
      If prime p, and $ab/p \in \mathbb{Z}$,
   then $a/p \in \mathbb{Z}$ or $b/p \in \mathbb{Z}$.
      More generally,
   if prime p, s.t. $a_1 a_2 \ldots a_n / p \in \mathbb{Z}$,
   then $\exists \ 1 \ \ a_i$ s.t. $a_i / p \in \mathbb{Z}$

Proof. If $p \nmid a$, i.e. $a/p \notin \mathbb{Z}$, then $\gcd(p, a) \equiv (p, a) = 1$.
   From Thm. 2,
$$1 = sp + ta$$
$$\implies b = spb + tab = p(sb + td)$$
ab/p and so $ab = pd$, so $b = spb + tdp$, i.e. b is a multiple of p ($b/p \in \mathbb{Z} \equiv p|b$).
       □

Corollary 1 (1.11 of Rotman (2010) [11]). *Let $a, b, c \in \mathbb{Z}$.*
   If c, a relatively prime, i.e. $\gcd(c, a) = 1$, and if $c|ab \equiv ab/c \in \mathbb{Z}$, then $c|b \equiv b/c \in \mathbb{Z}$

Proof.
$$\gcd(c, a) = 1 = sc + ta \implies b = sbc + tab = sbc + t(qc) = c(sb + tq) \implies b/c = sb + tq$$
       □

Theorem 4 (Euclidean Algorithm). *Let $a, b \in \mathbb{Z}^+$.*
$\exists$ *algorithm that finds $d = \gcd a, b$*

cf. pp. 5, Thm. 1.14 (Euclidean Algorithm), Ch. 1 Things Past of Rotman (2010) [11].

Proof.   □

Definition 6. *Let fixed $m \geq 0$. Then $a, b \in \mathbb{Z}$ are* **congruent modulo** m, *denoted by*

$$a \equiv b \bmod m$$

if $m | (a - b)$, i.e. $(a - b)/m \in \mathbb{Z}$, i.e. if $(a - b)/m \in \mathbb{Z}$, i.e. $(a - b)$ integer multiple of m

Proposition 1. *If $m \geq 0$ is fixed, $m \in \mathbb{Z}$, then $\forall\, a, b, c \in \mathbb{Z}$*

   (1) $a \equiv a \bmod m$
   (2) *if $a \equiv b \bmod m$, then $b \equiv a \bmod m$*
   (3) *if $a \equiv b \bmod m$, and $b \equiv c \bmod m$, then $a \equiv c \bmod m$*

cf. Prop. 1.18 of Rotman (2010) [11]

Proof.   (1) $(a - a)/m = 0/m = 0$
   (2) $(b - a)/m = (-1)(a - b)/m \in \mathbb{Z}$
   (3) $(a - c)/m = (a - b + b - c)/m = (a - b)/m + (b - c)/m \in \mathbb{Z}$

$\square$

EY : 20171225 to recap,

(3)

$$\boxed{\begin{array}{c} a \equiv b \bmod n \\[4pt] \text{meaning} \\[4pt] \dfrac{a - b}{n} \in \mathbb{Z} \text{ or } a - b = kn, \ k \in \mathbb{Z} \text{ or } a = b + kN \text{ but rather} \\[4pt] a = pn + r \\[4pt] b = qn + r \end{array}}$$

for $a = b + kn$, but b need not be a remainder of division of a by n. More precisely, $a = b \bmod n$ asserts that a, b have the same remainder when divided by n, i.e.

$$a = pn + r$$
$$b = qn + r$$

So $a \sim b$ or $[a] = [b]$ is an equivalence relation since
$a \sim a$ since $a \equiv a \bmod N$, since $a = a + 0N$,
if $a \sim b$, then $b \sim a$, since $a - b = kN$, then $b = a - kN$

if $a \sim b$, $b \sim c$, then $a \sim c$, since $a - b = kN$, then $a - c = (k + l)N$.
$$b - c = lN$$
cf. Prop. 1.19 of Rotman (2010) [11]

Proposition 2. *Let $m \geq 0$ be fixed*

   (1) *If $a = qm + r$, then $a \equiv r \bmod m$*
   (2) *If $0 \leq r' < r < m$, then $r \not\equiv \bmod m$ i.e. r and r' aren't congruent $\bmod m$*
   (3) *$a \equiv b \bmod m$ iff a, b leave same remainder after dividing by m*
   (4) *If $m \geq 2$, $\forall\, a \in \mathbb{Z}$, $a \equiv b \bmod m$ for some $b \in 0, 1, \ldots m - 1$*

Proof.   (1) If $a = qm + r$, then $a \equiv r \bmod m$
$$\frac{a - r}{m} = q \in \mathbb{Z}$$

   (2) *Want*: If $0 \leq r' < r < m$, then $r \not\equiv \bmod m$.

Suppose $\frac{r - r'}{m} = k \in \mathbb{Z}$. Then $r - r' = km$ or $r = r' + km$.

$$m > r > r' \leq 0$$
$$m > r' + km > r' \leq 0$$
$$m - r' > km > 0$$

But $k > 0$ (since $m > 0$ and $r - r' = km > 0$) and $m - r' > km > 0$ is a contradiction.

   (3) *Want*: $a \equiv b \bmod m$ iff a, b leave same remainder after dividing by m. By
      By Division Algorithm, this is true:
$$a = q_a m + r_a$$
$$b = q_b m + r_b$$
$$\frac{a - b}{m} = q_a + \frac{r_a}{m} - q_b - \frac{r_b}{m} = k = q_a - q_b + \frac{r_a - r_b}{m} \in \mathbb{Z}$$

Now
$$|m| > r_a \leq 0$$
$$|m| > r_b \leq 0$$

$2|m| > r_a + r_b$.
   And if $r_a > r_b$, $|m| > r_a > r_a - r_b > 0$.
   In both cases, $r_a = r_b$ since $q_a - q_b + \frac{r_a - r_b}{m} \in \mathbb{Z}$ needs to be enforced.
   (4) *Want*: If $m \geq 2$, $\forall\, a \in \mathbb{Z}$, $a \equiv b \bmod m$ for some $b \in 0, 1, \ldots m - 1$.
      By Division Algorithm, $a = q_a m + r_a$, $0 \leq r_a < |m|$. $\frac{a - r_a}{m} = q_a \in \mathbb{Z}$ so let $b = r_a$.

$\square$

Theorem 5 (1.26 of Rotman (2010) [11]). *If $gcd(a, m) \equiv (a, m) = 1$, then $\forall\, b \in \mathbb{Z}$, $\exists x$ s.t.*

$$ax \equiv b \bmod m$$

In fact, $x = sb$, where $sa \equiv 1 \bmod m$ is 1 solution. Moreover, any 2 solutions are congruent $\bmod m$.
i.e.
If $\gcd a, b = 1$, then $\forall\, y \in \mathbb{Z}$, $\exists x$ s.t. $ax \equiv y \bmod b$, $x = sy$, where $sa \equiv 1 \bmod b$ is 1 solution.
Moreover, any 2 solutions are congruent $\bmod m$. This implies that

  $ax \equiv y \bmod b$ or $\frac{Ax - y}{b} \in \mathbb{Z}$, and $\frac{(as - 1)y}{b} \in \mathbb{Z}$.
$sa \equiv 1 \bmod b$ or $\frac{sa - 1}{b} \in \mathbb{Z}$, which implies that $sa - 1 = b(-t)$ or

$$sa + tb = 1$$

for some $s, t \in \mathbb{Z}$.

Proof. $\gcd(a, m) = 1 = sa + tm$, by Thm. 2
   Then $b = b \cdot 1 = b(sa + tm) = sab + tmb$ or $b = tbm + sab$ or $a(sb) = -tbm + b$.
   So $a(sb) \bmod m \equiv b$.
   Let $x := sb$ and so $ax \bmod m = b$.
Now suppose $x \neq sb$ s.t. $ax \bmod m = b$. Then $ax = qm + b$. From $a(sb) \bmod m = b$, we also get $a(sb) = q'm + b$. Then $a(x - sb) \bmod m = 0$, so $m | a(x - sb) \equiv a(x - sb)/m \in \mathbb{Z}$.
   By Corollary 1 (which says, if $\gcd(c, a) = 1$ and if $ab/c \in \mathbb{Z}$, then $b/c \in \mathbb{Z}$), since $\gcd(m, a) = (m, a) = 1$, and since $a(x - sb)/m \in \mathbb{Z}$, then $(x - sb)/m \in \mathbb{Z}$. So $(x - sb) = qm$ or $(sb) \bmod m = x$.

$\square$

Proposition 3 (3.1 of Scheinerman (2006) [12]). *Let $a, b \in \mathbb{Z}$, let $c = a \bmod b$, i.e. $a = qb + c$ s.t. $0 \leq c < b$.*
  Then

(4)
$$gcd(a, b) = gcd(b, c)$$

cf. Sec. 3.3 Euclid's method of Scheinerman (2006) [12]

Proof. If d common divisor of a, b, i.e. $a/d, b/d \in \mathbb{Z} \equiv d|a, d|b$.

$c/d \in \mathbb{Z} \equiv d|c$ since $c = a - qb$.

If d is common divisor of b, c, i.e. $d|b, d|c \equiv c/d, b/d \in \mathbb{Z}$,

then $d|a \equiv a/d \in \mathbb{Z}$ since $a = qb + c$. So set of common divisors of a, b same as set of common divisors of b and c.

Then $\gcd(a, b) = \gcd(b, c)$.

1.2. **Euler's totient; relatively prime.** cf. Ch. 5 Arrays, Sec. 5.1 Euler's totient of Scheinerman (2006) [12]

For

$$\varphi : \mathbb{Z}^+ \to \mathbb{Z}^+$$

$$\varphi : n \mapsto \varphi(n) := \text{ number of elements of } \{1, 2, \ldots n\}$$

that are relative prime to

$$n = |\{i | i \in \{1, 2, \ldots n\}, (n, i) = 1 \text{ or equivalently } n \propto i\}|$$

e.g. $\varphi(10) = 4$ since $\varphi(10) = |\{1, 3, 7, 9\}|$.

we want $|(a, b) | 1 \leq a, b, \leq n, \gcd(a, b) \equiv (a, b) = 1|$.

$$p_n = \frac{1}{n^2} \left[-1 + 2 \sum_{i=1}^{n} \varphi(k) \right] =$$

= probability that 2 integers, chosen uniformly and independently from $\{1, 2, \ldots n\}$ are relatively prime

If p is prime, $\forall\, i \in \{1, 2, \ldots p\}$, $(p, i) \equiv \gcd(p, i) = 1$, i.e. relatively prime to p, except 1 $i \in \{1, 2, \ldots p\}$.

Therefore

$$\varphi(p) = p - 1$$

Consider $\varphi(p^2)$.

$\{1, 2, \ldots p^2\}$, only numbers *not* relatively prime to p^2 are multiples of p since

$p, 2p, 3p, \ldots p^2$ all divide p^2, i.e. $p|p^2, 2p|p^2 \ldots (p-1)p|p^2 \equiv p^2/p, p^2/2p, \ldots p^2/p(1-p)$.

Assume $\varphi(p^n) = p^2 - p^{n-1} = p^{n-1}(p-1)$.

$$\varphi(p^{n+1}) = \varphi(pp^n) = p^n\varphi(p) = p^n(p-1)$$

Therefore,

Proposition 4 (5.1). *Let p prime, $n \in \mathbb{Z}^+$*

e.g. $\varphi(77)$.

$\forall\, n$ s.t. $1 \leq n \leq 77$.

$$\gcd(n, 77) = 1$$
$$\gcd(n, 7) = 1$$
$$\gcd(n, 11) = 1$$

By Prop. 3,

$$\gcd(n, 7) = \gcd(7, n \mod 7)$$
$$\gcd(n, 11) = \gcd(11, n \mod 11)$$

cf. Example (10) of Dummit and Foote [2].

To recap,

Definition 7 (Euler φ-function). *$\forall\, n \in \mathbb{Z}^+$,*

let $\varphi(n) :=$ number of positive integers $a \leq n$ with a relatively prime to n, i.e. $\gcd(a, n) = 1 \equiv (a, n)$

e.g. $\varphi(12) = 4$, since $1, 5, 7, 11$ are only positive integers less than or equal to 12.

If p prime, $\varphi(p) = p - 1$.

More generally,

$\forall\, a \geq 1$,

(5) $$\boxed{\varphi(p^a) = p^a - p^{a-1} = p^{a-1}(p-1)}$$

φ is multiplicative in the sense that

(6) $$\varphi(ab) = \varphi(a)\varphi(b) \text{ if } \gcd(a, b) = 1$$

$\implies$ general formula.

If $n = p_1^{\alpha_1} p_2^{\alpha_2} \ldots p_s^{\alpha_s}$ (Fundanetal Thm. of Arithmetic, $\forall\, n \in \mathbb{Z}, n > 1$), then

(7) $$\boxed{\begin{array}{c} \varphi(n) = \varphi(p_1^{\alpha_1})\varphi(p_2^{\alpha_2}) \ldots \varphi(p_s^{\alpha_s}) \\ p_1^{\alpha_1 - 1}(p_1 - 1)p_2^{\alpha_2 - 1}(p_2 - 1) \ldots p_s^{\alpha_s - 1}(p_s - 1) \end{array}}$$

cf. pp. 69 Thm. 5.4 (Chinese Remainder) of Scheinerman (2006) [12].

Theorem 6. *Let $n \in \mathbb{Z}^+$,*

let $p_1, p_2, \ldots p_t$ be distinct prime divisors of n (i.e. $\forall\, p_i, \frac{n}{p_i^{k_i}} \in \mathbb{Z}$ for some $k_i \geq 1$)

Then

(8) $$\varphi(n) = n \left(1 - \frac{1}{p_1}\right)\left(1 - \frac{1}{p_2}\right) \ldots \left(1 - \frac{1}{p_t}\right)$$

Proof. By Fundamental Thm. of Arithmetic,

$$n = p_1^{e_1} p_2^{e_2} \ldots p_t^{e_t}$$

where p_j are distinct primes, and e_j are positive integers.

From Eqns. 5, 6, i.e. where

$$\varphi(p^a) = p^a - p^{a-1} = p^{a-1}(p-1)$$
$$\varphi(ab) = \varphi(a)\varphi(b) \text{ if } \gcd(a, b) = 1$$
$$\varphi(n) = \varphi(p_1^{e_1} p_2^{e_2} \ldots p_t^{e_t}) = \varphi(p_1^{e_1})\varphi(p_2^{e_2}) \ldots \varphi(p_t^{e_t}) =$$
$$= p_1^{e_1}(1 - \frac{1}{p_1})p_2^{e_2}(1 - \frac{1}{p_2}) \ldots p_t^{e_t}(1 - \frac{1}{p_t}) = n(1 - \frac{1}{p_1})(1 - \frac{1}{p_2}) \ldots (1 - \frac{1}{p_t})$$

Exercise 10. cf. pp. 7 Exercise 10 Dummit and Foote [2].

Prove: $\forall$ given $N \in \mathbb{Z}^+$ (positive number),

$\exists$ only finite many integers n with $\varphi(n) = N$, where φ denotes Euler's φ-function.

EY, Indeed, by definition,

$$\varphi(n) = N$$
$$a_1, a_2 \ldots a_N \text{ s.t. } a_i \leq n$$
$$\gcd(a_i, n) = 1 \text{ i.e. } 1 = s_i a_i + t_i n$$

Given $N \in \mathbb{Z}^+$, let $n \in \mathbb{Z}$, s.t. $\varphi(n) = N$ (given hypothesis).

Let $p = $ least (i.e. smallest) prime s.t. $p > N + 1$.

If $q \geq p$ is a prime divisor of n, i.e.

$$n = q^k m$$

for some $k \geq 1$, and m with q not dividing m.

Then

$$\varphi(n) = \varphi(q^k)\varphi(m) = q^{k-1}(q - 1)\varphi(m) \geq q - 1 \geq p - 1 > N$$

Contradiction.

Thus, $\nexists$ prime divisor of n greater than $N + 1$.

Particularly, distinct prime divisors of n belong to a finite set, say these primes are $p_1, p_2 \ldots p_m$.

Definition 8. *prime divisor q of n if q is prime and*

(9)
$$\frac{n}{q} \in \mathbb{Z} \ \text{i.e.} \ n = q^k m \ \text{for some} \ k \geq 1 \ \text{and} \ \frac{m}{q} \notin \mathbb{Z}^+$$

Now
$$n = p_1^{a_1} p_2^{a_2} \ldots p_m^{a_m}$$

for some $0 < a_i$, so
$$\varphi(n) = \varphi(p_1^{a_1})\varphi(p_2^{a_2})\ldots\varphi(p_m^{a_m}), \ \text{so} \ \varphi(n) = \prod_{i=1}^{m} p_i^{a_i-1}(p_i - 1)$$

Note, $\forall$ prime p_i, $\varphi(n) \geq p_i^{a_i-1}(p_i - 1) \geq p_i - 1 > N$ for sufficiently large a_i.

Thus, $\forall p_i$, $\exists$ only finitely many permissible choices for exponents a_i.

So set of all n with $\varphi(n) = N$ is subset of finite set, hence finite.

$\forall N \in \mathbb{Z}^+$, $\exists$ largest integer n with $\varphi(n) = N$.

Thus, as $n \to \infty$, $\varphi(n) \to \infty$.

Scheinerman (2006) [12]

cf. Ex. 1.19, pp. 13, Sec. 1.1 Some Number Theory of Rotman (2010) [11] **Exercise 1.19.** If a and b are relatively prime and if each divides an integer n, then their product ab also divides n, i.e.

Theorem 7. *If $\gcd a, b = 1$, and if $n/a \in \mathbb{Z} \equiv a|n$, and $n/b \in \mathbb{Z} \equiv b|n$, then $n/ab \in \mathbb{Z} \equiv ab|n$.*

Proof. $\gcd a, b = 1$, so $sa + tb = 1$ for some $s, t \in \mathbb{Z}$ (Thm. 5).

$\frac{n}{a}, \frac{n}{b} \in \mathbb{Z}$, so $n = au$, $n = bv$

$n = n \cdot 1 = n(sa + tb) = bvsa + autb = ab(vs + ut)$, so $\frac{n}{ab} = vs + ut \in \mathbb{Z}$. $\square$

1.2.1. *Chinese Remainder Theorem.*

Theorem 8. *If m, m' relatively prime (i.e. $\gcd(m, m') = 1$), then for*
$$x \equiv b \bmod m$$
$$x \equiv b' \bmod m'$$

i.e. given $b, b' m, m'$, and wanting to find x, $\exists x$ and $\forall 2x$'s, $x = x' \bmod mm'$, i.e.

Let m, n relatively prime positive integers (i.e. $\gcd m, n = 1$),
$\forall a, b \in \mathbb{Z}$,
then pair of congruences
$x \equiv a \bmod m$

$x \equiv b \bmod n$

has a solution (x), and this solution x is uniquely determined, modulo mn.

Proof. cf. The Chinese Remainder Theorem by Keith Conrad

Suppose

$(x - a)/m \in \mathbb{Z}$ or $x - a = my$

$(x - b)/n \in \mathbb{Z}$ or $x - b = nz$ or $a + my - b = nz$

$\gcd m, n = 1$, so then $\forall b \in \mathbb{Z}$, $\exists w$ s.t. $mw \equiv b \bmod n$ i.e. $\frac{mw-b}{n} \in \mathbb{Z}$, in fact, $w = sb$, where $sm \equiv 1 \bmod n$, or $\frac{sm-1}{n} \in \mathbb{Z}$, is 1 solution (Thm. 5).

$$my = b - a + nz$$
$$smy = sb - sa + snz = (1 + nv)y = s(b - a) + snz \ \text{or} \ y = s(b - a) + n(sz - vy)$$
$$\text{or} \ y \equiv s(b - a) \bmod n$$
$$x = a + my = a + m(s(b - a) + n(sz - vy)) = a + ms(b - a) + mn(sz - vy) \equiv a + ms(b - a) + mnu$$
$$x - a = m(s(b - a) + nu) \implies x = a \bmod m$$
$$x - b = a + ms(b - a) + mnu - b = a + (1 + m)(b - a) + mnu - b = m(b - a) + mnu \implies x \equiv b \bmod n$$

Uniqueness: Suppose $x, y \in \mathbb{Z}$ s.t.
$$x \equiv a \bmod m \qquad\qquad y \equiv a \bmod m$$
$$x \equiv b \bmod n \qquad\qquad y \equiv b \bmod n$$

Given $\gcd m, n = 1$, $sm + tn = 1$.

Since $\frac{x-a}{m}, \frac{y-a}{m} \in \mathbb{Z}$, $\frac{x-y}{m} \in \mathbb{Z}$, likewise, $\frac{x-a}{n}, \frac{y-a}{n} \in \mathbb{Z}$, $\frac{x-y}{n} \in \mathbb{Z}$

Since $\frac{x-y}{m}, \frac{x-y}{n} \in \mathbb{Z}$, $\frac{x-y}{mn} \in \mathbb{Z}$ by Thm. 7.

Thus, $x - y = mnk$ for some $k \in \mathbb{Z}$. For instance, $k = 0$, $x = y$.

This shows any 2 solutions are the same, modulo mn. $\square$

cf. Ch. 1 Things Past, Thm. 1.28 of Rotman (2010) [11], pp. 68 Thm. 5.2 (Chinese Remainder) of Scheinerman (2006) [12].

2. GROUPS

cf. pp. 16 Chapter 1 Introduction to Groups. Dummit and Foote (2004) [2]

Definition 9 (binary operation). (1) *binary operation $*$ on set G is a function $* : G \times G \to G$. $\forall a, b \in G$, $a * b \equiv *(a, b)$*
(2) *binary operation $*$ on set G is associative: if $\forall a, b, c \in G$, $a * (b * c) = (a * b) * c$*
(3) *If $*$ is binary operation on set G, a, b of G commut if $a * b = b * a$.*
   *$*$ (or G) is **commutative** if $\forall a, b \in G$ $a * b = b * a$.*

cf. pp. 16. Sec. 1.1. Basic Axioms and Examples, Dummit and Foote (2004) [2]

Definition 10 (Group). (1) *Group is an ordered pair $(G, *)$ where G is a set, $*$ is a binary operation on G s.t.*
   (a) *$(a * b) * c = a * (b * c)$, $\forall a, b, c \in G$, i.e. $*$ associative*
   (b) *$\exists e \in G$, s.t. $\forall a \in G$, $a * e = e * a = a$ ($\exists$ identity e)*
   (c) *$\forall a \in G$, $\exists a^{-1} \in G$, called an inverse of a, s.t. $a * a^{-1} = a^{-1} * a = e$*
(2) *(optional; abelian or commutative) $(G, *)$ abelian (or commutative) if $a * b = b * a$, $\forall a, b \in G$.*

e.g.
(1) $\mathbb{Z}, \mathbb{Q}, \mathbb{R}, \mathbb{C}$ are groups under $+$ with $e = 0$ and $a^{-1} = -a$, $\forall a$.
(2) $\mathbb{Q} - \{0\}, \mathbb{R} - \{0\}, \mathbb{C} - \{0\}, \mathbb{Q}^+, \mathbb{R}^+$ groups under $\times$ with $e = 1$, $a^{-1} = \frac{1}{a}$
(3) (**direct product of groups**)If $(A, *), (B, \circ)$ are groups, we can form new group $A \times B$ called **direct product** s.t.
$$A \times B = \{(a, b) | a \in A, b \in B\}$$
and $(a_1, b_1)(a_2, b_2) = (a_1 * a_2, b_1 \circ b_2)$ cf. Example 6, Sec. 1.1 Dummit and Foote (2004) [2]

Proposition 5. *If G group under operation $*$, then*

(1) *identity of G is unique*
(2) *$\forall a \in G$, a^{-1} uniquely determined.*
(3) *$(a^{-1})^{-1} = a \quad \forall a \in G$*
(4) *$(a * b)^{-1} = (b^{-1}) * (a^{-1})$*
(5) *$\forall a_1, a_2, \ldots a_n \in G$, $a_1, a_2 \ldots a_n$ independent of how expression is bracketed (generalized associative law)*

cf. Prop. 1, Sec. 1.1 Dummit and Foote (2004)[2]

3. GROUPS; NORMAL SUBGROUPS

Definition 11 (normal subgroup $K \lhd G$).
normal subgroup K *of* $G \equiv K \lhd G$ -
   subgroup $K \subset G$, *if* $\forall k \in K$, $\forall g \in G$,

$$gkg^{-1} \in K$$

Definition 12 (quotient group).
quotient group G mod $K \equiv G/K$ -
   if G/K = *family of all left cosets of subgroups* $K \subset G$ =

$$= \{gK | g \in G, K = \{gk | k \in K\}$$

and
   K = *normal subgroup of* G, *i.e.* $K \lhd G$, *and so*

$$aKbK = abK \qquad \forall a, b \in G,$$

so G/K *group.*

Definition 13 (exact sequence of groups). **exact sequence** *if* $\text{im} f_{n+1} = \ker f_n$ $\qquad \forall n$ *for sequence of group homomorphisms and groups*

(10)
$$G_{n+1} \xrightarrow{f_{n+1}} G_n \xrightarrow{f_n} G_{n-1}$$

Theorem 9. (1)

$$1 \qquad A \xrightarrow{f} B$$

(2)

$$B \xrightarrow{g} C \qquad 1$$

(3)

$$1 \qquad A \xrightarrow{h} B \qquad 1$$

Proof.   (1) $\text{im}(1 \to A) = 1$, since $1 \to A$ is a group homomorphism $((1 \to A)(1) = 1_A)$.
   if $1 \to A \xrightarrow{f} B$ exact, $\ker f = \text{im}(1 \to A) = 1$, so if $f(x) = 1$, $x = 1$, f injective.
   If f injective, $\ker f = 1$. $1 = \text{im}(1 \to A)$. $1 \to A \xrightarrow{f} B$, exact.
(2) $\ker(C \to 1) = C$, by def. of $C \to 1$
   if $B \xrightarrow{g} C \to 1$ exact, $\text{im} g = g(B) = \ker(C \to 1) = C$. $g(B) = C$ implies g surjective.
   If g surjective, $g(B) = C = \ker(C \to 1)$. $B \xrightarrow{g} C \to 1$ exact.
(3) From (i), $1 \to A \xrightarrow{h} B$ exact iff h injective. From (ii), $A \xrightarrow{h} B \to 1$, exact iff h surjective.
   h isomorphism. $\qquad \square$

3.1. **1st, 2nd, 3rd Isomorphism Theorems.**

Theorem 10 (1st Isomorphism Theorem (Modules) Thm. 7.8 of Rotman (2010) [11]). *If* $f : M \to N$ *is R-map of modules, then* $\exists R$-*isomorphism s.t.*

(11)
$$\varphi : M/\ker f \to \text{im} f$$
$$\varphi : m + \ker f \mapsto f(m)$$

Proof. View M, N as abelian groups.

   Recall natural map $\pi : M \to M/N$
$$m \mapsto m + N$$
   Define φ s.t. $\varphi \pi = f$.
   (φ well-defined). Let $m + \ker f = m' + \ker f$, $m, m' \in M$, then $\exists n \in \ker f$ s.t. $m = m' + n$.
$$\varphi(m + \ker f) = \varphi \pi(m) = f(m) = f(m' + n) = f(m') + f(n) = \varphi \pi(m') + 0 = \varphi(m' + \ker f)$$
$\implies \varphi$ well-defined.
   (φ surjective). Clearly, $\text{im}\varphi \subseteq \text{im} f$.
Let $y \in \text{im} f$. So $\exists m \in M$ s.t. $y = f(m)$. $f(m) = \varphi \pi(m) = \varphi(m + \ker f) = y$. So $y \in \text{im}\varphi$. $\text{im} f \subseteq \text{im}\varphi$.
$\implies \varphi$ surjective.
   (φ injective) If $\varphi(a + \ker f) = \varphi(b + \ker f)$, then
$$\varphi \pi(a) = \varphi \pi(b) \text{ or } f(a) = f(b) \text{ or } 0 = f(a) - f(b) = f(a - b) \text{ so } a - b \in \ker f(a - b) + \ker f = \ker f \text{ so } a + \ker f = b + \ker f$$
φ isomorphism.
   φ R-map. $\varphi(r(m + N)) = \varphi(rm + N) = f(rm)$.
Since f R-map, $f(rm) = rf(m) = r\varphi(m + N)$. φ is R-map indeed. $\qquad \square$

Theorem 11 (2nd Isomorphism Theorem (Modules) Thm. 7.9 of Rotman (2011) [11]). *If* S, T *are submodules of module* M, *i.e.* $S, T \in M$, *then* $\exists$ $R-$*isomorphism*

(12)
$$S/(S \cap T) \to (S + T)/T$$

Proof. Let natural map $\pi : M \to M/T$.
   So $\ker \pi = T$.
   Define $h := \pi|_S$, so $h : S \to M/T$, so $\ker h = S \cap T$,
$$(S + T)/T = \{(s + t) + T | a \in S + T, s \in S, t \in T\}$$
i.e. $(S + T)/T$ consists of all those cosets in M/T having a representation in S.
   By 1st. isomorphism theorem,
$$S/S \cap T \xrightarrow{\cong} (S + T)/T$$

$\qquad \square$

Theorem 12 (3rd Isomorphism Theorem (Modules) Thm. 7.10 of Rotman (2011) [11]). *If $T \subseteq S \subseteq M$ is a tower of submodules, then $\exists$ R-isomorphism*

$$M/T \xrightarrow{\quad g \quad} M/S$$

with π and $\cong$

(13) $\qquad (M/T)/(S/T) = (M/T)/\ker g$

$\qquad\qquad (M/T)/(S/T) \to M/S$

Proof. Define $g : M/T \to M/S$ to be **coset enlargement**, i.e.

(14) $\qquad\qquad\qquad g : M + T \mapsto m + S$

g well-defined: if $m + T = m' + T$, then $m - m' \in T \subseteq S$, and $m + S = m' + S \implies g(m + T) = g(m' + T)$

$\ker g = S/T$ since

$$g(s + T) = s + S = S \qquad (S/T \subseteq \ker g)$$
$$g(m + T) = m + S = 0 = S = s + S, \text{ so } m = s \implies \ker g \subseteq S/T$$

$\operatorname{im} g = M/S$ since

$$g(m + T) = m + S \implies \operatorname{im} g \subseteq M/S$$
$$m + S = g(m + T)$$

Then by 1st isomorphism, and commutative diagram, done. $\qquad\qquad\square$

4. RINGS

Definition 14 (division ring). *ring R with identity 1, where $1 \neq 0$ is a **division ring** (or skew field) if $\forall a \in R$, $a \neq 0$, $\exists$ multiplicative inverse $1/a$, i.e. $\exists b \in R$ s.t. $ab = ba = 1$*

e.g.

(1) rational numbers $\mathbb{Q}$
real numbers $\mathbb{R}$
complex numbers $\mathbb{C}$
are commutative rings with identity (in fact, they're fields)
Ring axioms for each follow ultimately from ring axioms for $\mathbb{Z}$
(verified when $\mathbb{Z}$ constructed from $\mathbb{Z}$ (Sec. 7.5)), $\mathbb{C}$ from $\mathbb{R}$ (Example 1, Sec. 13.1).
Construction of $\mathbb{R}$ from $\mathbb{Z}$ carried out in basic analysis texts
(2) **quotient group** $\mathbb{Z}/n\mathbb{Z}$ is a commutative ring with identity (element 1) under operations of addition and multiplication of residue classes (frequently referred to as "modular arithmetic").
We saw additive abelian groups axioms followed from general principles of theory of quotient groups ($\mathbb{Z}/n\mathbb{Z}$) was prototypical quotient group. cf. Example 4, pp. 224, Dummit and Foote (2014)[2]
(3) **the (real) Hamiltonian Quaternions**.

Definition 15 ((real) Hamiltonian Quaternions). *Let $\mathbb{H} = \{a + bi + cj + dk | a, b, c, d \in \mathbb{R}\}$ s.t. "componentwise" addition is defined as*

(15) $\qquad (a + bi + cj + dk) + (a' + b'i + c'j + d'k) = (a + a') + (b + b')i + (c + c')j + (d + d')k$

and multiplication defined by expanding using distributive laws

$$(a + bi + cj + dk)(a' + b'i + c'j + d'k)$$

using

(16)
$$i^2 = j^2 = k^2 = -1$$
$$ij = -ji = k$$
$$jk = -kj = i$$
$$ki = -ik = j$$

Working out the multiplication

$$(a + bi + cj + dk)(a' + b'i + c'j + d'k) =$$
$$= \begin{aligned} aa' + ab'i + ac'j + ad'k + ba'i - bb' + bc'k - bd'j + \\ ca'j - cb'k - cc' + cd'i + da'k + db'j - dc'i - dd' = \end{aligned}$$
$$= aa' - bb' - cc' - dd' + (ab' + ba' + cd' - dc')i + (ac' - bd' + ca' + db')j + (ad' + bc' - cb' + da')k$$

Hamiltonian Quaternions are noncommutative ring with identity $(1 = 1 + 0i + 0j + 0k)$.
Similarly define *rational* Hamiltonian Quaternions ring by taking $a, b, c, d \in \mathbb{Q}$.
real and rational Hamiltonian Quaternions both are divison rings, where inverse of nonzero element defined as

(17) $\qquad (a + bi + cj + dk)^{-1} = \dfrac{a - bi - cj - dk}{a^2 + b^2 + c^2 + d^2}$

cf. Example 5, pp. 224, Dummit and Foote (2014)[2]
(4) **rings of functions** (important class)
Let X be any nonempty set.
Let A be any ring.

Definition 16 (function ring). *collection $R = \{f : X \to A\}$ is a ring under pointwise addition and multiplication of functions s.t.*

(18)
$$(f + g)(x) = f(x) + g(x)$$
$$(fg)(x) = f(x)g(x)$$

cf. Example 6, pp. 225, Dummit and Foote (2014)[2]

5. COMMUTATIVE RINGS

cf. Ch. 3 "Commutative Rings I" of Rotman (2010) [11]

Definition 17. *commutative ring R is a set with 2 binary operations, addition and multiplication, s.t.*

(i) *R abelian group under addition*
(ii) *(commutativity) $ab = ba$ $\quad \forall a, b \in R$ (this isn't there for noncommutativity)*
(iii) *(associativity) $a(bc) = (ab)c$ $\quad \forall a, b, c \in R$*
(iv) *$\exists 1 \in R$ s.t. $1a = a$ $\quad \forall a \in R$ (many names used: one, unit, identity)*
(v) *(distributivity) $a(b + c) = ab + ac$ $\quad a, b, c \in R$ (this splits up into 2 distributivity laws for noncommutativity)*

To reiterate, abelian group under addition R (is defined as)

(1) associative $\forall x, y, z \in R$, $x + (y + z) = (x + y) + z$
(2) $\exists 0 \in R$, $0 + x = x + 0$, $\quad \forall x \in R$
(3) $\forall x \in R$, $\exists (-x) \in R$ s.t. $x + (-x) = 0 = (-x) + x$

abelian, if commutativity: $x + y = y + x$.

5.1. **Linear Algebra; Linear Algebra with commutative rings as fields.**

5.1.1. *Linear Algebra.*

Definition 18 (subspace). *If V vector space over field k,*
then subspace of V is subset U of V s.t.

(1) $0 \in U$
(2) $u, u' \in U$ *imply* $u + u' \in U$
(3) $u \in U$, *and* $a \in k$ *imply* $au \in U$

proper subspace *of $V \equiv U \subsetneq V$ is subspace $U \subseteq V$ with $U \neq V$.*

$U = V$, $U = \{0\}$ are always subspaces of a vector space V.

Examples (Example 3.70 Rotman (2010) [11])

(ii) If $V = (a_1, \ldots a_n)$, $v \neq 0$, $v \in \mathbb{R}^n$,
line through origin $l = \{av | a \in \mathbb{R}\}$ is a subspace of $\mathbb{R}^n$.
plane through origin $= \{av_1 + bv_2 | v_1, v_2$ fixed pair of noncollinear vectors, $a, b \in \mathbb{R}\}$ are subspaces of $\mathbb{R}^n$

(iii) If $m \leq n$, $\mathbb{R}^m$ regarded as set of all vectors in $\mathbb{R}^n$ s.t. last $n - m$ coordinates are 0, then $\mathbb{R}^m$ subspace of $\mathbb{R}^n$. e.g.
$\mathbb{R}^2 = \{(x, y, 0) \in \mathbb{R}^3\} \subsetneq \mathbb{R}^3$

(iv) If k field, **homogeneous linear system over** k of m equations in n unknowns is a set of equations

$$a_{11}x_1 + \cdots + a_{1n}x_n = 0$$
$$a_{21}x_1 + \cdots + a_{2n}x_n = 0$$
$$\vdots$$
$$a_{m1}x_1 + \cdots + a_{mn}x_n = 0$$

where $a_{ji} \in k$.
solution of this system is vector $(c_1 \ldots c_n) \in k^n$ s.t. $\sum_i a_{ji}c_i = 0$, $\forall j$.
solution $(c_1 \ldots c_n)$ **nontrivial** if $\exists$ some $c_i \neq 0$.
solution space (or null space) of system = set of all solutions.
solution space also a subspace of k^n
e.g. $k = \mathbb{I}_p$,

$$3x - 2y + z \equiv 1 \bmod 7$$
$$x + y - 2z \equiv 0 \bmod 7$$
$$-x + 2y + z \equiv 4 \bmod 7$$

Definition 19 (list). *list := vector space V is ordered set $v_1 \ldots v_n$ of vectors in V, i.e. $\exists$ some $n \geq 1$, $\exists$ some function φ*

$$\varphi : \{1, 2 \ldots n\} \to V$$

with $\varphi(i) = v_i$ $\quad \forall i$

Thus, $X = \mathrm{im}\varphi$.
X ordered, φ need not be injective.

Definition 20 (k-linear combination). *k-linear combination of list $v_1 \ldots v_n$ in V, $V \equiv$ vector space over field k, is vector v of*
form

$$v = a_1 v_1 + \cdots + a_n v_n = \sum_{i=1} a_i v_i \quad \forall a_i \in k, \quad \forall i$$

Definition 21 (list). *If list $X = v_1 \ldots v_m$ in vector space V, then*
subspace spanned by *X, $\langle v_1 \ldots v_m \rangle$:= set of all k-linear combinations of $v_1 \ldots v_m$. Also, say $v_1 \ldots v_m$ spans $\langle v_1 \ldots v_m \rangle$.*

Lemma 1 ($\langle v_1 \ldots v_m \rangle$ is smallest subspace of V containing $v_1 \ldots v_m$). (i) *Every intersection of subspaces of V is itself a subspace.*

(ii) *If $X = v_1 \ldots v_m$ list in V, then intersection of all subspaces of V containing X is $\langle v_1 \ldots v_m \rangle$, subspace spanned by $v_1 \ldots v_m$, so $\langle v_1 \ldots v_m \rangle$ is smallest subspace of V containing X.*

cf. (Lemma 3.71 Rotman (2010) [11])

Proof. (i) Consider $\bigcap_{\alpha \in I} V_\alpha$, $\forall \alpha \in I$, V_α subspace of V
(i) $0 \in V_\alpha$, $\forall \alpha \in I$, so $0 \in \bigcap_{\alpha \in I} V_\alpha$,
(ii) Let $u, u' \in \bigcap_{\alpha \in I} V_\alpha$. Then $u, u' \in V_\alpha$, $\forall \alpha \in I$. Consider $\beta \in I$. $u, u' \in V_\beta$, so $u + u' \in V_\beta$. Without loss of generality, $u + u' \in V_\alpha$, $\forall \alpha \in I$. Then $u + u' \in \bigcap_{\alpha \in I} V_\alpha$
(iii) Let $u \in \bigcap_{\alpha \in I} V_\alpha$. Consider $\alpha \in k$. Since $u \in V_\alpha$, $\forall \alpha \in I$, $au \in V_\alpha$, $\forall \alpha \in I$. Then $au \in \bigcap_{\alpha \in I} V_\alpha$

(ii) Let $X = \{v_1 \ldots v_m\}$, let $\mathcal{S} \equiv$ family of all subspaces of V containing X.
$\bigcap_{S \in \mathcal{S}} S \subseteq \langle v_1 \ldots v_m \rangle$ because $\langle v_1 \ldots v_m \rangle \in \mathcal{S}$, since,
$\langle v_1 \ldots v_m \rangle$ is *a* subspace of V containing X.
If $S \in \mathcal{S}$, then $S \ni v_1 \ldots v_m$. As shown above, $\forall v \in \langle v_1 \ldots v_m \rangle$, $v \in S$, and thus $v \in \bigcap_{S \in \mathcal{S}} S$. $\langle v_1 \ldots v_m \rangle \subseteq \bigcap_{S \in \mathcal{S}} S$. $\square$

Were all terminology in algebra consistent,
$\langle v_1 \ldots v_m \rangle \equiv$ subspace *generated* by X.
Reason for different terms is that group theory, rings, vector spaces developed independently of each other.

Example 3.72 of Rotman (2010) [11]

(i)
(ii)
(iii) **polynomial vector space; polynomials as a vector space**.
Vector space need not be spanned by finite list.
e.g. $V = k[x]$,
Suppose $X = f_1(x) \ldots f_m(x)$ finite list in V.
If $d =$ largest degree of any of $f_i(x)$,
then every (nonzero) k-linear combination of $f_1(x), \ldots f_m(x)$ has degree at most d.
Thus $x^{d+1} \notin \langle f_1(x) \ldots f_m(x) \rangle$, so X doesn't span $k[x]$

Definition 22 (finite-dimensional vector space; infinite-dimensional vector space). *Vector space V is finite-dimensional if it's spanned by a finite list; otherwise V is infinite-dimensional.*

Proposition 6 (linear dependent span properties). *If vector space V, list $X = v_1 \ldots v_m$ spanning V, following are equivalent:*

(i) *X isn't shortest spanning list*
(ii) *some v_i is in subspace spanned by others, i.e. $v_i \in \langle v_i \ldots \widehat{v_i} \ldots v_m \rangle$,*
(iii) *$\exists a_1 \ldots a_m$ not all 0 s.t. $\sum_{l=1}^m a_l v_l = 0$*

Proof. (i) $\implies$ (ii). If X isn't hosrtest spanning list, then 1 of vectors in X can be thrown out, and shorter list still spans, i.e. cf. Lemma 1(Lemma 3.71, Rotman (2010) [11]); let $\mathcal{S} \equiv$ family of all subspaces of V containing X.
EY: 20180610 Let $\bigcap_{S \in \mathcal{S}} S$. $\bigcap_{S \in \mathcal{S}} S \neq \langle v_1 \ldots v_m \rangle$, $\bigcap_{S \in \mathcal{S}} S \subset \langle v_1 \ldots v_m \rangle$
$\exists v \in \langle v_1 \ldots v_m \rangle$, say $v = \sum_{i=1}^m a_i v_i$ s.t. $\exists S \in \mathcal{S}$, s.t. $v \notin S$.
(ii) $\implies$ (iii) If $v_i = \sum_{j \neq i} c_j v_j$, define $a_i = -1 \neq 0$, $a_j = c_j$, $\forall j \neq i$. Then $\sum_{l=1}^m a_l v_l = -v_i + \sum_{j \neq i} c_j v_j = 0$
(iii) $\implies$ (i) Suppose for $i \in 1 \ldots m$, $a_i \neq 0$. $v_i = -\sum_{j \neq i} \frac{a_j}{a_i} v_j$. $\langle v_1 \ldots \widehat{v_i} \ldots v_m \rangle$ still spans V (i.e. deleting v_i gives a shorter list, which still spans).
For instance, if $v \in \langle v_1 \ldots v_m \rangle$, $v = \sum_{l=1}$ $\square$

Exercise 3.67. Suppose $\dim V > 1$. Then $\exists$ at least 2 elements in a basis of V, say e_1, e_2. (Thm. 3.78 of Rotman (2010) [11], "Every finite-dim. vector space V has a basis; Def. of dim, "number of elements in a basis of V").

Consider subspaces $\langle e_1 \rangle$, $\langle e_2 \rangle$, subspaces spanned by e_1, e_2, respectively. Whether $V = \langle e_1, e_2 \rangle$ or $V = \langle e_1, e_2 \rangle$, $\langle e_1 \rangle, \langle e_2 \rangle \neq \{0\}$ nor V. Contradiction of hypothesis.

Thus, "If only subspaces of a vector space V are $\{0\}$ and V itself, $\dim(V) \leq 1$."

Proposition 7 (Matrix representation of linear transformation; 3.94 of Rotman (2010) [11]). *If linear transformation $T : k^n \to k^m$, then $\exists A \in \operatorname{Mat}_k(m, n)$ s.t.*
$$T(y) = Ay, \qquad \forall y \in k^n$$

Proof. Let
$$(e_1 \dots e_n) \quad \text{standard basis of } k^n$$
$$(e_1' \dots e_m') \quad \text{standard basis of } k^m$$
Define $A = [a_{ij}]$, s.t. $T(e_j) = A_{*j} = A_{ij} e_i'$ (jth column),
$$S : k^n \to k^m$$
If $S(y) = A(y)$, then
$$T(e_j) = a_{ij} e_i' = A e_j$$
and so $\forall y = y_j e_j \in k^n$,
$$T(y) = T(y_j e_j) = y_j T(e_j) = y_j A_{ij} e_i' = Ay$$
$\square$

6. R-MODULES

cf. Sec. 7.1 Modules of Rotman (2010) [11]

Definition 23 (R-module). *R-module is (additive) abelian group M,*

equipped with scalar multiplication $R \times M \to M$
$$(r, m) \mapsto rm$$
s.t. $\forall m, m' \in M$, $\forall r, r', 1 \in R$
(i) $r(m + m') = rm + rm'$
(ii) $(r + r')m = rm + r'm$
(iii) $(rr')m = r(r'm)$
(iv) $1m = m$

Example 7.1

(i) $\forall$ *vector space* over field k is a k-module. (by inspection of the axioms for a vector space, associativity, distributivity!)
(ii) $\forall$ abelian group is a $\mathbb{Z}$-module, by laws of exponents (Prop. 2.23)
    Indeed, for
$$\mathbb{Z} \times M \to M$$
$$(r, m) \mapsto rm \equiv m^r$$
    and so
$$r(m \cdot m') \equiv (m \cdot m')^r = m^r (m')^r = rm + rm'$$
    (since M abelian)
(iii) For commutative ring, scalar multiplication, defined to be given multiplication of elements of R
$$R \times R \to R$$
$$(a, b) \mapsto ab$$

For reference, recall some of the properties of a commutative ring:
$$ab = ba$$
$$a(bc) = (ab)c$$
$$1a = a$$
$$a(b + c) = ab + ac$$

$\forall$ ideal I in R is an R-module,

for if $i \in I$, then $ri \in I$.
$$r \in R$$
$$0 \in I$$
$$\forall a, b \in I, \ a + b \in I$$
If $a \in I$, $r \in R$, then $ra \in I$.
(iv)
(v) Let linear $T : V \to V$, V finite-dim. vector space over field k.
    Recall $k[x] \equiv$ set of polynomials with coefficients in k.

$$k[x] \times V \to V$$
Define
$$f(x)v = \left(\sum_{i=0}^{m} c_i x^i \right) v = \sum_{i=0}^{m} c_i T^i(v) \qquad \forall f(x) = \sum_{i=0}^{m} c_i x^i \in k[x]$$
$\implies$ denote $k[x]$-module V^T.

Special case: Let $A \in \operatorname{Mat}_k(n, n)$, let linear $T : k^n \to k^n$.
$$T(w) = Aw$$
vector space k^n is $k[x]$-module if we define scalar multiplication

$$k[x] \times k^n \to k^n$$
$$f(x)w = \left(\sum_{i=0}^{m} c_i x^i \right) w = \sum_{i=0}^{m} c_i A^i w$$

$\forall f(x) = \sum_{i=0}^{m} c_i x^i \in k[x]$
In $(k^n)^T$, $xw = T(w)$
In $(k^n)^A$, $xw = Ax$
$T(w) = Ax$ and so $(k^n)^T = (k^n)^A$ (EY : 20151015 because of induction?)

Definition 24 (R-homomorphism (or R-map)). *If ring R, R-modules M, N, then function $f : M \to N$, if $\forall m, m' \in M$, $\forall r \in R$,*
$$f(m + m') = f(m) + f(m')$$
$$f(rm) = rf(m)$$

Example 7.2. of Rotman (2011) on pp. 425 [11]]

(i) If R field, then R-modules are vector spaces and R-maps are linear transformations. Isomorphisms are then nonsingular linear transformations.
(ii)
(iii)
(iv)
(v) Let linear $T : V \to V$, let $v_1 \dots v_n$ be basis of V, let A be matrix of T relative to this basis.
    Let $e_1 \dots e_n$ be standard basis of k^n.

Define $\varphi : V \to k^n$
$$\varphi(v_i) = e_i$$

$$\varphi(xv_i) = \varphi(T(v_i)) = \varphi(v_j a_{ji}) = a_{ji}\varphi(v_j) = a_{ji}e_j$$

$$x\varphi(v_i) = A\varphi(v_i) = Ae_i$$

$\implies \varphi(xv) = x\varphi(v) \quad \forall v \in V$

By induction on $\deg(f)$, $\varphi(f(x)v) = f(x)\varphi(v) \quad \forall f(x) \in k[x] \quad \forall v \in V$

$\implies \varphi$ is $k[x]$-map

$\implies \varphi$ is $k[x]$-isomorphism of V^T and $(k^n)^A$.

Proposition 8 (7.3 of Rotman (2011) [11]). *Let vector space over field k, V, let linear $T, S : V \to V$*
Then $k[x]$-modules V^T, V^S are $k[x]$-isomorphic iff $\exists$ vector space isomorphism $\varphi : V \to V$ s.t. $S = \varphi T \varphi^{-1}$.

Proof. If $\varphi : V^T \to V^S$ is a $k[x]$-isomorphism,

$$\varphi(f(x)v) = f(x)\varphi(v) \quad \forall v \in V, \forall f(x) \in k[x]$$

if $f(x) = x$, then $\varphi(xv) = x\varphi(v)$

$$xv = T(v)$$
$$x\varphi(v) = S(\varphi(v))$$
$$\implies \varphi \circ T(v) = S \circ \varphi(v) \implies \varphi \circ T = S \circ \varphi$$

φ isomorphism, so $S = \varphi \circ T \circ \varphi^{-1}$

Conversely, if given isomorphism $\varphi : V \to V$ s.t. $S = \varphi T \varphi^{-1}$, then $S\varphi = \varphi T$.

$$S\varphi(v) = \varphi T(v) = \varphi(xv) = x\varphi(v)$$

Then by induction, $\varphi(x^n v) = x^n \varphi(v)$ (for $S^n \varphi(v) = x^n \varphi(v) = (\varphi T \varphi^{-1})^n \varphi(v) = \varphi T^n v = \varphi(x^n v)$).
By induction on $\deg(f)$, $\varphi(f(x)v) = f(x)\varphi(v)$. □

Corollary 2 (7.4 of Rotman (2011) [11]). *Let k be a field,*
Let $A, B \in Mat_k(n,n)$.
Then $k[x]$-modules $(k^n)^A$, $(k^n)^B$ are $k[x]$-isomorphic.
(recall, $k[x] \equiv$ set of polynomials with coefficients in $k = \{\sum_{i=0}^{m} c_i x^i | c_i \in k\}$, and define scalar multiplication

$$k[x] \times k^n \to k^n$$

$$f(x)w = \left(\sum_{i=0}^{m} c_i x^i\right) w = \sum_{i=0}^{m} c_i A^i w, \qquad \forall f(x) = \sum_{i=0}^{m} c_i x^i \in k[x]$$

)
iff $\exists$ nonsingular P with

$$B = PAP^{-1}$$

Proof. Define
$T : k^n \to k^n$
$\qquad$ where $y \in k^n$ is a column.
$T(y) = A(y)$
By Example 7.1 (v) of Rotman (2011) [11], recall,
and so for $k[x]$-module, $(k^n)^T = (k^n)^A$.
Similarly, define

$$S : k^n \to k^n$$
$$S(y) = B(y)$$

Denote corresponding $k[x]$-module by $(k^n)^B$.
Given $(k^n)^A \cong (k^n)^B$ (isomorphic), by Prop. 8,
$\exists$ isomorphism $\varphi : k^n \to k^n$ s.t. $B = \varphi A \varphi^{-1}$.

By Prop. 7, i.e. Prop. 3.94 of Rotman (2011) [11], in that every linear transformation has a matrix representation (even in the standard "Euclidean" basis), $\exists P \in \text{Mat}_k(n,n)$, s.t.

$$\varphi(y) = Py \qquad y \in k^n$$

(P nonsingular because φ isomorphism)
$\quad$ Thus,

$$B\varphi(y) = \varphi A(y)$$
$$BPy = P(Ay) \qquad \forall y \in k^n$$
$$\implies PA = BP \text{ or } B = PAP^{-1}$$

Conversely, given $B = PAP^{-1}$, P nonsingular matrix,
define isomorphism

$$\varphi : k^n \to k^n$$
$$\varphi(y) = Py \qquad \forall y \in k^n$$

By Prop. 8,
$(k^n)^B$, $(k^n)^A$ are $k[x]$-isomorphic.
i.e. $\varphi : (k^n)^A \to (k^n)^B$ is a $k[x]$-module isomorphism. □

Definition 25 ($\text{Hom}_R(M,N)$).
(19)

$$\text{Hom}_R(M,N) = \{ \text{ all } R\text{-homomorphisms } M \to N \} = \{f | f : M \to N, \ s.t. \ \forall m, m' \in M, \forall r \in R, \begin{array}{l} f(m+m') = f(m) + f(m') \\ f(rm) = rf(m) \end{array}\}$$

If $f, g \in \text{Hom}_R(M,N)$,
define

$$f + g : M \to N$$

(20)

$$f + g : m \mapsto f(m) + g(m)$$

Proposition 9 ($\text{Hom}_R(M,N)$ R-module, 7.5 of Rotman (2011) [11]). *If M, N R-modules, where R commutative ring,*
then $\text{Hom}_R(M,N)$ R-module,
with addition

$$f + g : M \to N \qquad \forall f, g \in \text{Hom}_R(M,N)$$
$$f + g : m \mapsto f(m) + g(m)$$

and scalar multiplication

$$rf : m \mapsto f(rm)$$

Moreover, distributive laws:
If $p : M' \to M$, $q : N \to N'$, then

$$(f+g)p = fp + gp \text{ and } q(f+g) = qf + qg$$

$\forall f, g \in \text{Hom}_R(M,N)$

Proof. $\forall f, g \in \text{Hom}_R(M,N), \forall r, r', 1 \in R$,
(i)

$$r(f+g)(m) = (f+g)(rm) = f(rm) + g(rm) = rf(m) + rg(m) = (rf + rg)(m)$$

(ii)

$$(r+r')f(m) = f((r+r')m) = f(rm + r'm) = f(rm) + f(r'm) = (rf + r'f)(m)$$

(iii)

$$(rr')f(m) = f(rr'm) = rf(r'm) = f(r'rm) = f(rr'm) \implies (rr')f = r(r'f)$$

(iv)

$$1f(m) = f(1m) = f(m) \implies 1f = f$$

Definition 26. *if R-module M, the submodule N of M, denoted $N \subseteq M$, is additive subgroup N of M, closed under scalar multiplication $rn \in N$ whenever $n \in N$, $r \in R$*

Definition 27 (quotient module M/N).
***quotient module** M/N -*
  For submodule N of R-module M, then,
remember M abelian group, N subgroup,
quotient group M/N equipped with scalar multiplication

$$r(m + N) = rm + N$$
$$M/N = \{m + N | m \in M\}$$

natural map

(21)
$$\pi : M \to M/N$$
$$m \mapsto m + N$$

easily seen to be R-map.
  Scalar multiplication in quotient module well-defined:
If $m + N = m' + N$, $m - m' \in N$, so $r(m - m') \in N$ (because N submodule), so
$$rm - rm' \in N \text{ and } rm + N = rm' + N$$

Proposition 10 (7.15 of Rotman (2010) [11]).   (i) $S \bigsqcup T \simeq M$

  (ii) $\exists$ *injective R-maps* $i : S \to M$, *s.t.*
$$j : T \to M$$
$$M = im(i) + im(j) \text{ and}$$
(22)
$$im(i) \bigcap im(j) = \{0\}$$

  (iii) $\exists$ *R-maps*
$$i : S \to M$$
$$j : T \to M$$
s.t. $\forall m \in M$, $\exists !$
$$s \in S$$
$$t \in T$$
with $m = is + jt$.

  (iv) $\exists$ *R-maps*
$$i : S \to M \qquad p : M \to S$$
$$j : T \to M \qquad q : M \to T$$
s.t.
$$pi = 1_S \qquad pj = 0$$
$$qj = 1_T \qquad , \quad qi = 0 \qquad ip + jq = 1_M$$

Proof.   • (i)$\to$ (ii) Given $S \bigsqcup T \simeq M$,
  let $\varphi : S \bigsqcup T \to M$ be this isomorphism.
    Define
$$i := \varphi \lambda_S \qquad (\lambda_S : s \mapsto (s, 0)) \qquad i : S \to M$$
$$j := \varphi \lambda_T \qquad (\lambda_T : t \mapsto (0, t)) \qquad j : T \to M$$
i, j are injections, being composites of injections.

$\square$

If $m \in M$, $\exists ! (s, t) \in S \bigsqcup T$, s.t. $\varphi(s, t) = m$.
Then
$$m = \varphi(s, t) = \varphi((s, 0) + (0, t)) = \varphi\lambda_S(s)\varphi\lambda_T(t) = is + jt \in im(i) + im(j)$$

Let $c \in im(i) + im(j)$. Since $i : S \to M$, $c \in M$.
$$j : T \to M$$
$\implies M = im(i) + im(j)$.
If $x \in im(i) \bigcap im(j)$,
$$x = i(s) \text{ for some } s \in S$$
$$x = j(t) \text{ for some } t \in T$$

$$is = jt = \varphi\lambda_S(s) = \varphi\lambda_T(t) = \varphi(s, 0) = \varphi(0, t)$$

φ isomorphism, so $\exists \varphi^{-1} \implies (s, 0) = (0, t)$, so $s = t = 0$. $x = 0$

• (ii)$\to$ (iii) Given $i : S \to M$, s.t. $M = im(i) + im(j)$, so
$$j : T \to M$$
$\forall m \in M$, $m = i(s) + j(t)$ for some $s \in S, t \in T$.

  Suppose $s' \in S$, s.t. $m = i(s'_+ j(t')$.
  $t' \in T$
$$i(s - s') = j(t - t') \in im(i) \bigcap im(j) = \{0\}$$

So $s = s', t = t'$, since i, j injective.
• (iii)$\to$ (iv)
  Given $\forall m \in M$, $\exists ! s \in S, t \in T$ s.t.
$$m = i(s) + j(t)$$

Define
$$p : M \to S \qquad q : M \to T$$
$$p(m) := s \qquad q(m) := t$$

$$pi(s) = s \qquad pj(t) = 0$$
$$qj(t) = t \qquad qi(s) = 0 \qquad (ip + jq)(m) = ip(m) + jq(m) = i(s) + j(t) = m$$

$\square$

7. CATEGORIES; CATEGORY THEORY

7.1. **Categories.** cf. 7.2 Categories of Rotman (2010) [11]

7.1.1. *Russell paradox, Russell set.*

Definition 28 (Russell set). *Russell set - set S that's not a member of itself, i.e. $S \notin R$*

If R is family of all Russell sets,
Let $X \in R$. Then $X \notin X$. But $X \in R$. $X \notin R$.
Let $R \notin R$. Then R in family of Russell Sets. $R \in R$. Contradiction.
Then consider *class* as primitive term, instead of set.

Definition 29 (Category). *Category $\mathcal{C}$ (Rotman's notation) $\equiv$ $\mathbf{C}$ (my notation), consists of class $obj(\mathcal{C})$ (Rotman's notation) $\equiv Obj(\mathbf{C}) \equiv Obj\mathbf{C}$ (my notation) of objects, set of morphisms $Hom(A, B)$ $\forall (A, B)$ of ordered tuples of objects, composition*

$$Hom(A, B) \times Hom(B, C) \to Hom(A, C)$$
$$(f, g) \mapsto gf$$

, s.t.

(1) $\exists \mathbf{1}, \forall f : A \to B, \exists 1_A : A \to A$, *s.t.* $1_B \cdot f = f = f \cdot 1_A$, *and*
$$1_B : B \to B$$

(2) *associativity,* $\forall \begin{array}{l} f : A \to B \\ g : B \to C \\ h : C \to D \end{array}$, *then* $h \circ (g \circ f) = (h \circ g) \circ f$

In summary,

(23)
$$\mathbf{C} := (Obj(\mathbf{C}), Mor\mathbf{C}, \circ, \mathbf{1}) \equiv (Obj\mathbf{C}, Mor\mathbf{C}, \circ_{\mathbf{C}}, \mathbf{1_C})$$

s.t.
$$Mor\mathbf{C} = \bigcup_{A, B \in Obj\mathbf{C}} Hom(A, B)$$

Examples (7.25 of Rotman (2010)[11]):

(i) $\mathbf{C} = $ Sets
(ii) $\mathbf{C} = $ Groups $= $ Grps
(iii) $\mathbf{C} = $ CommRings
(iv) $\mathbf{C} = {}_R\mathbf{Mod}$, if $R = \mathbb{Z}$, ${}_\mathbb{Z}\mathbf{Mod} = \mathbf{Ab}$, i.e. $\mathbb{Z}-$modules are just abelian groups.
(v) $\mathbf{C} = \mathbf{PO}(X)$, If partially ordered set X, regard X as category, s.t. $\mathbf{Obj}, \mathbf{PO}(X) = \{x | x \in X\}$, $\forall \text{Hom}(x, y) \in$

$\mathbf{Mor_{PO}}(X), \text{Hom}(x, y) = \begin{cases} \emptyset & \text{if } x \not\preceq y \\ \kappa_y^x & \text{if } x \preceq y \end{cases}$ where $\kappa_y^x \equiv$ unique element in Hom set when $x \preceq y$) s.t.

$$\kappa_z^y \kappa_y^x = \kappa_z^x$$

Also, notice that
$$1_x = \kappa_x^x$$

Definition 30 (isormorphisms or equivalences). $f : A \to B$, $f \in Hom(A, B)$, if $\exists$ **inverse** $g : B \to A$, $g \in Hom(B, A)$, s.t.
$$gf = 1_A$$
$$fg = 1_B$$

and if $\mathbf{C} = \boldsymbol{Top}$, *equivalences (isomorphisms) are homeomorphisms.*

Feature of category ${}_R\mathbf{Mod}$ not shared by more general categories: *Homomorphisms can be added.*

Definition 31 (pre-additive Category). *category* $\mathbf{C}$

We can force 2 overlapping subsets A, B to be disjoint by "disjointifying" them: e.g. consider $(A \cup B) \times \{1, 2\}$, consider

$$A' = A \times \{1\}.$$
$$B' = B \times \{2\}$$
$$\implies A' \cap B' = \emptyset$$

since $(a, 1) \neq (b, 2)$ $\forall a \in A, \forall b \in B$.

Let bijections $\alpha : A \to A'$, $\alpha : a \mapsto (a, 1)$, denote $A' \bigcup B' \equiv A \coprod B$.
$\beta : B \to B'$ $\beta : b \mapsto (b, 2)$
From Rotman (2010) [11], pp. 447,

Definition 32. *coproduct* $A \coprod B \equiv C \in Obj(\mathcal{C})$

In my notation,
coproduct

(24)
$$(\mu_1, A_1 \coprod A_2)$$
$$(\mu_2, A_1 \coprod A_2)$$

where injection (morphisms)

(25)
$$\mu_1 : A_1 \to A_1 \coprod A_2$$
$$\mu_2 : A_1 \to A_1 \coprod A_2$$
s.t.

$$\forall A \in \text{Obj}\mathbf{A}, \forall f_1, f_2 \in \text{Mor}\mathbf{A} \text{ s.t. } f_1 : A_1 \to A$$
$$f_2 : A_2 \to A$$

then

(26)
$$\exists ! [f_i] \equiv [f_1, f_2] \in \text{Mor}\mathbf{A}, [f_1, f_2] : A_1 \coprod A_2 \to A \text{ s.t.}$$
$$[f_1, f_2]\mu_1 = f_1$$
$$[f_1, f_2]\mu_2 = f_2$$

i.e.

(27)

So to generalized, for $i \in I$, (finite set I?)

coproduct $(\mu_j, \coprod_{i \in I} A_i)_{j \in I}$, where
(family of) injection (morphisms) $\mu_j : A_j \to \coprod_{i \in I} A_i$
  s.t.

$$\forall A \in \mathrm{Obj}\mathbf{A}, \ \forall f_i \in \mathrm{Mor}\mathbf{A}, \ i \in I, \ f_i : A_i \to A$$

then

(28)
$$\exists ! \, [f_i] \equiv [f_i]_{i \in I} \in \mathrm{Mor}\mathbf{A}, \ [f_i] : \coprod_{i \in I} A_i \to A \ \text{s.t.}$$

$$[f_i]\mu_j = f_j \qquad \forall j \in I$$

i.e.

(29)

For notation purposes only, recall that it's denoted the sets $\mathrm{Hom}(A,B)$ in $_R\mathbf{Mod}$ by

$$\mathrm{Hom}_R(A,B)$$

i.e., in my notation, for $A, B \in \mathrm{Obj}_R\mathbf{Mod}$, $\mathrm{Hom}(A,B) \subset \mathrm{Mor}(_R\mathbf{Mod})$, $\mathrm{Hom}(A,B) \equiv \mathrm{Hom}_R(A,B)$

Definition 33 (pre-additive category). *category* $\mathbf{C}$ *is* ***pre-additive*** *if* $\forall \, Hom(A,B)$, $Hom(A,B)$ *equipped with binary operation* $+$ *s.t.* $\forall f, g \in Hom(A,B)$,

  (1) *if* $p : B \to B'$, *then*

$$p(f+g) = pf + pg \in Hom(A,B')$$

  (2) *if* $q : A' \to A$, *then*

$$(f+g)q = fq + gq \in Hom(A',B)$$

   and

$$f + g = g + f \qquad \text{(additive abelian)}$$

7.1.2. *Examples of extra assumptions on sets,* $_R\mathbf{Mod}$ *we take for granted.* In Prop. 7.15(iii) Rotman (2010) [11],

direct sum $M = A \oplus B$ if $\exists$ homomorphisms
$$
\begin{aligned}
p &: M \to A & pi &= 1_A \\
q &: M \to B \ \text{s.t.} & qj &= 1_B, \\
i &: A \to M & pj &= 0 \\
j &: B \to M & qi &= 0 \\
& & ip + jq &= 1_M
\end{aligned}
$$

direct sum $M = A \oplus B$ uses property that morphisms can be added $_R\mathbf{Mod}$ has this property. $\mathbf{Sets}$ don't.
  In Corollary 7.17,
direct sum in terms of arrows,
$\exists$ map $\rho : M \to S$ s.t. $\rho(s) = s$. Moreover $\ker\rho = \mathrm{im}j$, $\mathrm{im}\rho = \mathrm{im}i$ and $\rho(s) = s$, $\forall s \in \mathrm{im}\rho$.

$$S \xrightarrow{\ i\ } M \xleftarrow{\ j\ } T \qquad \text{and } M \simeq S \coprod T,$$

where $i : s \mapsto s$ (i.e. inclusions)
     $j : t \mapsto t$
  This makes sense in $\mathbf{Sets}$, but doesn't make sense in arbitrary categories because image of morphism may fail, e.g. $\mathrm{Mor}(\mathcal{C}(G))$ are elements in $\mathrm{Hom}(*,*) = G$, not functions.
  Categorically, object S is (equivalent to) retract of object M, $S, M \in \mathrm{Obj}\mathbf{C}$, if $\exists$ morphisms $i, p \in \mathrm{Mor}(\mathbf{C})$, s.t.

$$i : S \to M$$
$$p : M \to S$$

s.t. $pi = 1_S$, $(ip)^2 = ip$ (for modules, define $\rho = ip$)

Definition 34 (free products). ***free products*** *are coproducts in groups*

  Prop. 7.26, Rotman (2010) [11]

Proposition 11 (7.26, Rotman). *If* A, B *are* R-*modules, then their coproducts in* $_R\mathbf{Mod}$ *exists, and it's the direct sum* $C = A \coprod B$.

Proof. Define
$$
\begin{array}{llll}
\mu : A \to C & \nu : B \to C & & \alpha : A \to C \\
\mu : a \mapsto (a, c) & \nu : b \mapsto (0, b) & \text{(Rotman's notation)} & \beta : B \to C
\end{array}
$$

Let X be a module, $f : A \to X$, $g : B \to X$ homomorphisms

  Define
$$\theta : C \to X$$
$$\theta : (a, b) \mapsto f(a) + g(b)$$

$$\theta\mu(a) = \theta(a, 0) = f(a)$$
$$\theta\nu(b) = \theta(0, b) = g(b)$$

so diagram commutes, i.e.

If $\psi : C \to X$ makes diagram commute,
$$\psi((a, 0)) = f(a) \qquad \forall a \in A$$
$$\psi((0, b)) = g(b) \qquad \forall b \in B$$

and since ψ is a homomorphism, $\psi((a, b)) = \psi((a, 0)) + \psi((0, b)) = f(a) + g(b) = \theta((a, b))$. $\psi = \theta$.
 Prop. 7.27, Rotman (2010) [11]

Proposition 12 (7.27, Rotman). *If category* $\mathcal{C} = \mathbf{C}$, *and if* $A, B \in Obj\mathbf{C}$, *then* $\forall$ *2 coproducts of* A, B, *if they* $\exists$, *are equivalent.*

Proof. Suppose C, D coproducts of A, B. Suppose coproducts $\mu_A : A \to C$, $\nu_A : A \to D$
$$\mu_B : B \to C, \quad \nu_B : B \to D$$

Just substitute $X = D$ in diagram above.
    Then substitute again:

Then combine the 2 diagrams: $\psi\theta = 1_C$. Likewise by label symmetry of C, D, $\theta\psi = 1_D$.
    Then C, D are equivalent. $\square$

    Exer. 7.29 on pp. 459 of Rotman (2010) [11]

Definition 35. *If $A, B \in Obj\mathbf{C}$, then their* **product**; *$A \prod B = P \in Obj\mathbf{C}$, and morphisms $p : P \to A$ s.t. $\forall X \in Obj\mathbf{C}$,*
$$q : P \to B$$

$\forall \, f : X \to A \in Mor\mathbf{C}$,
   $g : X \to B \in Mor\mathbf{C}$
$\exists ! \, \theta : X \to P$, s.t.
If the notation of Kashiwara and Schapira (2006) [1],
In general
    product *of X_i's,*
$$\prod_i X_i \equiv \prod_{i \in I} X_i$$

given by

(30)
$$\prod_i X_i := \varprojlim \alpha$$

    When $X_i = X$, $\forall \, i \in I$, denote product by $X^{\prod I} \equiv X^I$.

    e.g. Cartesian product $P = A \times B$ of 2 sets A, B, $A, B \in Obj\mathbf{Sets}$.
    Define
$$p : A \times B \to A \qquad q : A \times B \to B$$
$$p(a, b) \mapsto a \qquad q(a, b) \mapsto b$$

If $X \in Obj\mathbf{Sets}$,

if $f : X \to A$, then $\theta : X \to A \times B$
$g : X \to B \qquad \theta : x \mapsto (f(x), g(x)) \in A \times B$

Proposition 13 (7.28 Rotman (2010); equivalence of products, if it exists)**.** *If $A, B \in Obj\mathbf{C}$, then $\forall$ 2 products of A and B, should they exist, are equivalent.*

Proof. Suppose C, D products of A, B. Suppose products $p_A : C \to A$, $q_A : D \to A$
$$p_B : C \to B, \quad q_B : D \to B$$

Just substitute $X = D$ in diagram above.

Then substitute again:

$$
\begin{array}{ccc}
& C & \\
p_A \swarrow & \downarrow \psi & \searrow p_B \\
A \xleftarrow{q_A} & D & \xrightarrow{q_B} B
\end{array}
$$
Then combine the 2 diagrams: $\psi\theta = 1_C$. Likewise by label symmetry of C, D, $\theta\psi = 1_D$.

Then C, D are equivalent.

□

### 7.1.3. Products of Modules and Sets.

Proposition 14 (7.29 Rotman (2010); products of R-modules are equivalent). *If commutative ring R,*
R-modules A, B,
then $\exists$ their (categorical) product $A \sqcup B$, in fact

(31)
$$A \sqcap B \cong A \sqcup B$$

Proof. If $A \sqcup B \cong M$, then $\exists$ R-maps, $i : S \to M$, $\quad p : M \to S$ s.t. $pi = 1_A$ $\quad$ and $pj = 0$, and $ip + jq = 1_M$, i.e.
$j : T \to M$ $\quad q : M \to T$ $\quad qj = 1_B$ $\quad qi = 0$

$$A \xleftarrow[p]{i} M \xleftarrow[q]{j} B$$

If module X, since $f : X \to A$ are homomorphisms,
$\quad\quad g : X \to B$

define $\begin{array}{l} \theta : X \to A \sqcup B \\ \theta(x) = if(x) + jg(x) \end{array}$ so that

$$
\begin{array}{ccc}
& X & \\
f \swarrow & \downarrow \theta & \searrow g \\
A \xleftarrow{p} & A\sqcup & \xrightarrow{q} B
\end{array}
$$

since, $\forall x \in X$,

$$p\theta(x) = pif(x) + pjg(x) = pif(x) + 0 = f(x)$$

since $ip + jq = 1_{A\sqcup B}$

$$\psi = ip\psi + jq\psi = if + jf = \theta$$

so product is unique.

□

Definition 36. *Let R be commutative ring,*
let $\{A_i : i \in I\}$ be indexed family of R-modules.

direct product $\prod_{i\in I} A_i$ is cartesian product (i.e. set of all I-tuples (a_i) whose ith coordinate a_i lies in A_i $\quad \forall i$) with coordinate wise addition and scalar multiplication:

$$(a_i) + (b_i) = (a_i + b_i)$$
$$r(a_i) = (ra_i)$$

where $r \in R$, $a_i, b_i \in A_i$, $\quad \forall i$
cf. Thm. 7.32 of Rotman (2010) [11]

Theorem 13 (7.32, Rotman). *Let commutative ring R.*
$\forall$ R-module A, $\forall$ family $\{B_i | i \in I\}$ of R-modules,

(32)
$$Hom_R(A, \prod_{i\in I} B_i) \simeq \prod_{i\in I} Hom_R(A, B_i)$$

□

via R-isomorphism

$$\varphi : f \mapsto (p_i f)$$

where p_i are projections of product $\coprod_{i\in I} B_i$

Proof. Let $a \in A$, $f, g \in Hom_R(A, \coprod_{i\in I} B_i)$.

$$\varphi(f + g)(a) = (p_i(f + g))(a) = (p_i(f(a) + g(a))) = (p_i f + p_i g)(a)$$

φ additive.

$\forall i, \forall r \in R$, $p_i rf = rp_i f$ (since product of R-modules, $\coprod_{i\in I} B_i$ is also an R-module of $Obj_R\mathbf{Mod}$, by def. of product).

$$\varphi rf \mapsto (p_i rf) = (rp_i f) = r(p_i f) = r\varphi(f)$$

So φ is R-map.

If $(f_i) \in \coprod_i Hom_R(A, B_i)$, then $f_i : A \to B_i$ $\quad \forall i$

By Rotman's Prop. 7.31 (If family of R-modules $\{A_i | i \in I\}$, then direct product $C = \coprod_{i\in I} A_i$ is their product in $_R\mathbf{Mod}$),

By def. or product, $\exists ! R$-map , $\theta : A \to \coprod_{i\in I} B_i$ s.t. $p_i\theta = f_i$ $\quad \forall i$

$$
\begin{array}{ccc}
& & A \\
& f_i \swarrow & \downarrow \theta \\
B_i & \xleftarrow{p_i} & \prod_{i\in I} B_i
\end{array}
$$
Then

$$f_i) = (p_i\theta) = \varphi(\theta)$$

, and so φ surjective.

Suppose $f \in \ker\varphi$, so $\theta = \varphi(f) = (p_i f)$. Thus $p_i f = 0$ $\quad \forall i$

$$
\begin{array}{ccc}
& & A \\
& 0 \swarrow & \downarrow f \\
B_i & \xleftarrow{p_i} & \prod_{i\in I} B_i
\end{array}
$$

But 0-homomorphism also makes this diagram commute, so uniqueness of homomorphism $A \to \prod B_i$ gives $f = 0$.

□

ERNEST YEUNG ERNESTYALUMNI@GMAIL.COM

8. APPLICATIONS OF CATEGORY: FINITE STATE MACHINES (FSM)

Definition 37 (Finite State Machines ≡ Finite State Automaton). *A deterministic finite state machine or acceptor deterministic finite state machine is a quintuple* $(\Sigma, S, s_0, \delta F)$ *where*
$\Sigma \equiv$ *input alphabet (finite, non-empty set of symbols)*
$S \equiv$ *finite, non-empty set of states*
$s_0 \equiv$ *initial state,* $s_0 \in S$
$\delta \equiv$ *state-transition function;* $\delta : S \times \Sigma \to S$ *(in a nondeterministic finite automaton, it would be* $\delta : S \times \Sigma \to \mathcal{P}(S)$*), i.e.* δ *would return a set of states;* $\mathcal{P}(S) \equiv$ *set of all subsets of S, including* $\emptyset$ *and* $S \equiv$ *power set.*
$F \equiv$ *set of final states, (possibly empty subset of S;* $F \subseteq S$ *or* $F \subseteq S \cup \{\emptyset\}$*)*
   Finite State Machine (FSM) is also known as a Finite State Automaton.

   cf. Black, Paul E (12 May 2008). "Finite State Machine". *Dictionary of Algorithms and Data Structres*. U.S. National Institute of Standards and Technology (NIST).
   For both deterministic and non-deterministic FSMs, it's conventional to allow δ to be a partial function, i.e. $\delta(q, x)$ doesn't have to be defined for every combination of $q \in S$, $x \in \Sigma$
   If FSM M is in state q; the next symbol (input?) is x and $\delta(q, x)$ not defined; then M can announce an error (i.e. reject the input (???)).

Definition 38 (Alphabet). *alphabet* := *nonempty set of symbols* ≡ Σ
*string* := *finite sequence of members (i.e. symbols) of an underlying base set (i.e.* **alphabet***)*
$\Sigma^n \equiv$ *set of all strings of length n.*

   Using Algebraic Geometry. David A. Cox. John Little. Donal O'Shea. Second Edition. Springer. 2005. ISBN 0-387-20706-6 QA564.C6883 2004

15. Introduction

15.1. Polynomials and Ideals. *monomial*

(33)
$$(1.1) \qquad x_1^{\alpha_1} \ldots x_n^{\alpha_n}$$

total degree of x^α is $\alpha_1 + \cdots + \alpha_n \equiv |\alpha|$

field k, $k[x_1 \ldots x_n]$ collection of all polynomials in $x_1 \ldots x_n$ with coefficients k.

polynomials in $k[x_1 \ldots x_n]$ can be added and multiplied as usual, so $k[x_1 \ldots x_n]$ has structure of commutative ring (with identity)
however, only nonzero constant polynomials have multiplicative inverses in $k[x_1 \ldots x_n]$, so $k[x_1 \ldots x_n]$ not a field
however set of rational functions $\{f/g | f,g \in k[x_1 \ldots x_n], g \neq 0\}$ is a field, denoted $k(x_1 \ldots x_n)$

so

$$f = \sum_\alpha c_\alpha x^\alpha$$

where $c_\alpha \in k$
so

$$f \in k[x_1 \ldots x_n] = \{f | f = \sum_\alpha c_\alpha x^\alpha, x^\alpha = x_1^{\alpha_1} \ldots x_n^{\alpha_n}, c_\alpha \in k\}$$

f homogeneous if all monomials have same total degrees
polynomial f is homogeneous if all monomials have the *same total degree*

Given a collection of polynomials $f_1 \ldots f_s \in k[x_1 \ldots x_n]$, we can consider all polynomials which can be built up from these by multiplication by arbitrary polynomials and by taking sums

Definition 40 (1.3). *Let* $f_1 \ldots f_s \in k[x_1 \ldots x_n]$
Let $\langle f_1 \ldots f_s \rangle = \{p_1 f_1 + \cdots + p_s f_s | p_i \in k[x_1 \ldots x_n]$ *for* $i = 1 \ldots s\}$

Exercise 1.

(a) $x^2 = x \cdot (x - y^2) + y \cdot (xy)$
(b)
$$p \cdot (x - y^2) = px - py^2$$

and for $pxy = (py)x$
(c)
$$p(y)(x - y^2) = p(y)x - p(y)y^2 \notin \langle x^2, xy \rangle$$

Exercise 2.
$$\sum_{i=1}^s p_i f_i + \sum_{j=1}^s q_j f_j = \sum_{i=1}^s (p_i + q_i) f_i, \quad p_i + q_i \in k[x_1 \ldots x_n]$$

$\langle f_1 \ldots f_s \rangle$ closed under sums in $k[x_1 \ldots x_n]$

If $f \in \langle f_1 \ldots f_s \rangle$,
$p \in k[x_1 \ldots x_n]$

$$p \cdot f = p \sum_{i=1}^s q_j f_j = \sum_{i=1}^s p q_j f_j, \quad p q_j \in k[x_1 \ldots x_n] \text{ so}$$

$$p \cdot f \in \langle f_1 \ldots f_s \rangle$$

Done.

The 2 properties in Ex. 2 are defining properties of ideals in the ring $k[x_1 \ldots x_n]$

Definition 41 (1.5). *Let* $I \subset k[x_1 \ldots x_n]$, $I \neq \emptyset$
I ideal if

(a) $f + g \in I$, $\forall f, g \in I$
(b) $pf \in I$, $\forall f \in I$, *arbitrary* $p \in k[x_1 \ldots x_n]$

Thus $\langle f_1 \ldots f_s \rangle$ is an ideal by Ex. 2.

we call it the ideal generated by $f_1 \ldots f_s$.

Exercise 3. Suppose $\exists$ ideal J, $f_1 \ldots f_s \in J$ s.t. $J \subset \langle f_1 \ldots f_s \rangle$
if $f \in \langle f_1 \ldots f_s \rangle$, $f = \sum_{i=1}^s p_i f_i$, $p_i \in k[x_1 \ldots x_n]$

$\forall i = 1 \ldots s$, $p_i f_i \in J$ and so $\sum_{i=1}^s p_i f_i \in J$, by def. of J as an ideal.

$$\langle f_1 \ldots f_s \rangle \subseteq J \qquad \implies J = \langle f_1 \ldots f_s \rangle$$

$\implies \langle f_1 \ldots f_s \rangle$ is smallest ideal in $k[x_1 \ldots x_n]$ containing $f_1 \ldots f_s$

Exercise 4. For $I = \langle f_1 \ldots f_s \rangle$
$$J = \langle g_1 \ldots g_t \rangle$$
$I = J$ iff $s = t$ and $\forall f \in I$, $f = \sum_{i=1}^t q_i g_i$ and if $0 = \sum_{i=1}^t q_i g_i$, $q_i = 0$, $\forall i = 1 \ldots t$, and if $0 = \sum_{i=1}^s p_i f_i$, $p_i = 0$, $\forall i = 1 \ldots s$

Definition 42 (1.6).
$$\sqrt{I} = \{g \in k[x_1 \ldots x_n] | g^m \in I \text{ for some } m \geq 1\}$$

e.g. $x + y \in \sqrt{\langle x^2 + 3xy, 3xy + y^2 \rangle}$
in $\mathbb{Q}[x, y]$ since

$$(x + y)^3 = x(x^2 + 3xy) + y(3xy + y^2) \in \langle x^2 + 3xy, 3xy + y^2 \rangle$$

- (Radical Ideal Property) $\forall$ ideal $I \subset k[x_1 \ldots x_n]$, $\sqrt{I}$ ideal, $\sqrt{I} \supset I$
- **(Hilbert basis Thm.)** $\forall$ ideal $I \subset k[x_1 \ldots x_n]$
  $\exists$ finite generating set,
  i.e. $\exists \{f_1 \ldots f_2\} \subset k[x_1 \ldots x_n]$ s.t. $I = \langle f_1 \ldots f_s \rangle$
- (Division Algorithm in $k[x]$) $\forall f, g \in k[x]$ (EY : in 1 variable)
  $\forall f, g \in k[x]$ (in 1 variable)
  $f = qg + r$, $\exists!$ quotient q, $\exists$ remainder r

15.2.

15.3. Gröbner Bases.

Definition 43 (3.1). *Gröbner basis for* $I \equiv G = \{g_1 \ldots g_k\} \subset I$ *s.t.* $\forall f \in I$, $LT(f)$ *divisible by* $LT(g_i)$ *for some* i

- (Uniqueness of Remainders) let ideal $I \subset k[x_1 \ldots x_n]$
  division of $f \in k[x_1 \ldots x_n]$ by Gröbner basis for I, produces $f = g + r$, $g \in I$, and no term in r divisible by any element of $LT(I)$

15.4. Affine Varieties. affine n-dim. space over k $\quad k^n = \{(a_1 \ldots a_n) | a_1 \ldots a_n \in k\}$

$\forall$ polynomial $f \in k[x_1 \ldots x_n]$, $(a_1 \ldots a_n) \in k^n$

$\quad f : k^n \to k$

$\quad f(a_1 \ldots a_n)$ s.t. $x_i = a_i$ i.e.

if $f = \sum_\alpha c_\alpha x^\alpha$ for $c_\alpha \in k$, then

$\quad f(a_1 \ldots a_n) = \sum_\alpha c_\alpha a^\alpha \in k$, where $a^\alpha = a_1^{\alpha_1} \ldots a_n^{\alpha_n}$

Definition 44 (4.1). *affine variety* $\mathbf{V}(f_1 \ldots f_s) = \{(a_1 \ldots a_n) | (a_1 \ldots a_n) \in k^n, f_1(x_1 \ldots x_n) = \cdots = f_s(x_1 \ldots x_n) = 0\}$
subset $V \subset k^n$ *is affine variety if* $V = V(f_1 \ldots f_s)$ *for some* $\{f_i\}$, *polynomial* $f_i \in k[x_1 \ldots x_n]$

- (Equal Ideals Have Equal Varieties) If $\langle f_1 \ldots f_s \rangle = \langle g_1 \ldots g_t \rangle$ in $k[x_1 \ldots x_n]$, then $\mathbf{V}(f_1 \ldots f_s) = \mathbf{V}(g_1 \ldots g_t)$

so, recap
if $\langle f_1 \ldots f_s \rangle = \langle g_1 \ldots g_t \rangle$ in $k[x_1 \ldots x_n]$,
then $V(f_1 \ldots f_s) = V(g_1 \ldots g_t)$

Recall Hilbert basis Thm. $\forall$ ideal $I \subset k[x_1 \ldots x_n]$

$$I = \langle f_1 \ldots f_s \rangle$$

$\implies$ if $I = J$, then $V(I) = V(J)$
think of V defined by I, rather than $f_1 = \cdots = f_s = 0$

Exercise 3.
Recall Def. 1.5 Let $I \subset k[x_1 \ldots x_n]$

I ideal if $f + g \in I \quad \forall f, g \in I$
$\quad pf \in I, \quad \forall f \in I$ arbitrary $p \in k[x_1 \ldots x_n]$
Let $f, g \in I(V)$

$$(f+g)(a_1 \ldots a_n) = f(a_1 \ldots a_n) + g(a_1 \ldots a_n) = 0 + 0 = 0 \qquad f + g \in I(V)$$
$$pf(a_1 \ldots a_n) = p(a_1 \ldots a_n)f(a_1 \ldots a_n) = 0 \qquad pf \in I(V)$$

Then $I(V)$ an ideal.
$\quad V = V(x^2)$ in $\mathbb{R}^2$
$I = \langle x^2 \rangle$ in $\mathbb{R}[x,y], \quad I = \{px^2 | p \in k[x,y]\}$
$\quad I \subset I(V)$, since $px^2 = 0$ for $x^2 = 0$, $(0, b), \quad b \in \mathbb{R}$
But $p(x, y) = x \in I(V)$, as

$$I(V) = \{f \in k[x_1 \ldots x_n] | f(a_1 \ldots a_n) = 0, \forall (a_1 \ldots a_n) \in V\}$$

$\quad p(0, b) = x = 0$
$\quad$ But $x \notin I$

Exercise 4. $I \subset \sqrt{I}$
Recall Def. 1.6 $\sqrt{I} = \{g \in k[x_1 \ldots x_n] | g^m \in I$ for some $m \geq 1\}$
$\forall f \in I, f = f^1, m = 1$, so $f \in \sqrt{I}, \quad I \subset \sqrt{I}$
Hilbert basis thm., $\forall$ ideal $I \subset k[x_1 \ldots x_n]$ s.t. $I = \langle f_1 \ldots f_s \rangle$
$\{ \substack{V(I) = \{(a_1 \ldots a_n) | (a_1 \ldots a_n) \in k^n, f_1(a_1 \ldots a_n) = \cdots = f_s(a_1 \ldots a_n) = 0\}} \}$
$\mathbf{I}(\mathbf{V}(I)) = \{f \in k[x_1 \ldots x_n] | f(a_1 \ldots a_n) = 0 \quad \forall (a_1 \ldots a_n) \in V(I)\}$
Let $g \in \sqrt{I}, \quad g^m \in I, \quad g^m = g^{m-1}g$
$\quad g^m(a_1 \ldots a_n) = 0 = g^{m-1}(a_1 \ldots a_n)g(a_1 \ldots a_n) = 0$. Then $g(a_1 \ldots a_n) = 0$ or $g^{m-1}(a_1 \ldots a_m) = 0$
as $g^m \in I$, and $V(I)$ is s.t. $f_1(a_1 \ldots a_n) = \cdots = f_s(a_1 \ldots a_n) = 0$ for $I = \langle f_1 \ldots f_s \rangle$

- (Strong Nullstellensatz) if k algebraically closed (e.g. $\mathbb{C}$), I ideal in $k[x_1 \ldots x_n]$, then

$$\mathbf{I}(\mathbf{V}(I)) = \sqrt{I}$$

- (Ideal-variety correspondence) Let k arbitrary field

$$I \subset I(V(I))$$
$$V(I(V)) = V \quad \forall V$$

Additional Exercises for Sec.4. Exercise 6.

16. Solving Polynomial Equations

16.1.

16.2. Finite-Dimensional Algebras. Gröbner basis $G = \{g_1 \ldots g_t\}$ of ideal $I \subset k[x_1 \ldots x_n]$,
recall def.: Gröbner basis $G = \{g_1 \ldots g_t\} \subset I$ of ideal I, $\forall f \in I$, $\mathrm{LT}(f)$ divisible by $\mathrm{LT}(g_i)$ for some i
$\quad f \in k[x_1 \ldots x_n]$ divide by G produces $f = g + r$, $g \in I$, r not divisible by any $\mathrm{LT}(I)$ uniqueness of r
$f \in k[x_1 \ldots x_n]$ divide by G,
$\quad$ Recall from Ch. 1, divide $f \in k[x_1 \ldots x_n]$ by G, the division algorithm yields

$$(34) \qquad (2.1) \qquad f = h_1 g_1 + \cdots + h_t g_t + \overline{f}^G$$

where remainder $\overline{f}^G$ is a linear combination of monomials $x^\alpha \notin \langle \mathrm{LT}(I) \rangle$

$\quad$ since Gröbner basis, $f \in I$ iff $\overline{f}^G = 0$
$\quad \forall f \in k[x_1 \ldots x_n]$, we have coset $[f] = f + I = \{f + h | h \in I\}$ s.t. $[f] = [g]$ iff $f - g \in I$
$\quad$ We have a 1-to-1 correspondence

$$\text{remainders} \leftrightarrow \text{cosets}$$
$$\overline{f}^G \leftrightarrow [f]$$

algebraic

$$\overline{f}^G + \overline{g}^G \leftrightarrow [f] + [g]$$
$$\overline{f}^G \cdot \overline{g}^G \leftrightarrow [f] \cdot [g]$$

$B = \{x^\alpha | x^\alpha \notin \langle \mathrm{LT}(I) \rangle\}$ is a basis of A, basis monomials, standard monomials
$\quad$ 20141023 EY's take
$\quad \forall [f] \in A = k[x_1 \ldots x_n]/I, \quad [f] = p_i b_i; \quad b_i \in B = \{x^\alpha | x^\alpha \notin \langle \mathrm{LT}(I) \rangle\}$
For $I = \langle G \rangle$
$\quad$ e.g. $G = \{x^2 + \frac{3}{2}xy + \frac{1}{2}y^2 - \frac{3}{2}x - \frac{3}{2}y, xy^2 - x, y^3 - y\}$
$\langle \mathrm{LT}(I) \rangle = \langle x^2, xy^2, y^3 \rangle$
e.g. $B = \{1, x, y, xy, y^2\}$
$\quad [f] \cdot [g] = [fg]$
e.g. $f = x, g = xy, [fg] = [x^2 y]$
now $f = h_1 g_1 + \cdots + h_t g_t + \overline{f}^G$

16.3.

16.4. Solving Equations via Eigenvalues and Eigenvectors.

17. Resultants

18. Computation in Local Rings

18.1. Local Rings.

Definition 45 (1.1).

$$k[x_1 \dots x_n]_{\langle x_1 \dots x_n \rangle} \equiv \{ \frac{f}{g} | \text{ rational functions } \frac{f}{g} \text{ of } x_1 \dots x_n \text{ with } g(p) \neq 0 \text{ at } p \}$$

main properties of $k[x_1 \dots x_n]_{\langle x_1 \dots x_n \rangle}$

Proposition 15 (1.2). *Let* $R = k[x_1 \dots x_n]_{\langle x_1 \dots x_n \rangle}$. *Then*

(a) *R subring of field of rational functions $k(x_1 \dots x_n) \supset k[x_1 \dots x_n]$*
(b) *Let $M = \langle x_1 \dots x_n \rangle \subset R$ (ideal generated by $x_1 \dots X_n$ in R)*
  Then $\forall \frac{f}{g} \in R \backslash M$, $\frac{f}{g}$ unit in R (i.e. multiplicative inverse in R)
(c) *M maximal ideal in R*

Exercise 1. if $p = (a_1 \dots a_n) \in k^n$, $R = \{ \frac{f}{g} | f, g \in k[x_1 \dots x_n], g(p) \neq 0 \}$

(a) *R subring of field of rational functions $k(x_1 \dots x_n)$*
(b) *Let M ideal generated by $x_1 - a_1 \dots x_n - a_n$ in R*
  Then $\forall \frac{f}{g} \in R \backslash M$, $\frac{f}{g}$ unit in R (i.e. multiplicative inverse in R)
(c) *M maximal ideal in R*

Proof. let $p = (a_1 \dots a_n) \in k^n$
let $g_1(p) \neq 0$, $g_2(p) \neq 0$

$$\frac{f_1}{g_1} + \frac{f_2}{g_2} = \frac{f_1 g_2 + f_2 g_1}{g_1 g_2} \qquad g_1(p) g_2(p) \neq 0 \text{ so } \frac{f_1}{g_1} + \frac{f_2}{g_2} \in R$$

$$\frac{f_1}{g_1} \cdot \frac{f_2}{g_2} = \frac{f_1 f_2}{g_1 g_2} \qquad g_1(p) g_2(p) \neq 0 \text{ so } \frac{f_1}{g_1} \frac{f_2}{g_2} \in R$$

$f = \frac{f}{1} \in R, \qquad \forall f \in k[x_1 \dots x_n], \text{ so } k[x_1 \dots x_n] \subset R$

EY : 20141027, to recap,
Let $V = k^n$
Let $p = (a_1 \dots a_n)$
single pt. $\{p\}$ is (an example of) a variety
$I(\{p\}) = \{x_1 - a_1 \dots x_n - a_n\} \subset k[x_1 \dots x_n]$

$R \equiv k[x_1 \dots x_n]_{\langle x_1 - a_1 \dots x_n - a_n \rangle}$

$$R = \{ \frac{f}{g} | \text{ rational function } \frac{f}{g} \text{ of } x_1 \dots x_n, g(p) \neq 0, p = (a_1 \dots a_n) \}$$

Prop. 1.2. properties

(a) R subring of field of rational functions $k(x_1 \dots x_n)$ $k(x_1 \dots x_n) \subset R$
(b) $M = \langle x_1 \dots a_1 \dots x_n - a_n \rangle \subset R$. ideal generated by $x_1 - a_1 \dots x_n - a_n$
  Then $\forall \frac{f}{g} \in R \backslash M$, $\frac{f}{g}$ unit in R ($\exists$ multiplicative inverse in R)
(c) M maximal ideal in R.
  in R we allow denominators that are not elements of this ideal $I(\{p\})$

Definition 46 (1.3). *local ring is a ring that has exactly 1 maximal ideal*

Proposition 16 (1.4). *ring R with proper ideal $M \subset R$ is local ring if $\forall \frac{f}{g} \in R \backslash M$ is unit in R*

localization Ex. 8, Ex. 9
parametrization

Exercise 2.

$$x = x(t) = \frac{-2t^2}{1 + t^2}$$

$$y = y(t) = \frac{2t}{1 + t^2}$$

$k[t]_{\langle t \rangle}$ $\frac{-2t^2}{1+t^2}$ rational function of t. $1 + t^2 \neq 0$
  if $k = \mathbb{C}$ or $\mathbb{R}$

Consider set of convergent power series in n variables

$$(35) \qquad (1.5) \qquad k\{x_1 \dots x_n\} = \{ \sum_{\alpha \in \mathbb{Z}_{\geq 0}^n} c_\alpha x^\alpha | c_\alpha \in k, \text{ series converges in some open } U \ni 0 \in k^n \}$$

Consider set $k[[x_1 \dots x_n]]$ of formal power series

$$(36) \qquad (1.6) \qquad k[[x_1 \dots x_n]] = \{ \sum_{\alpha \in \mathbb{Z}_{\geq 0}^n} c_\alpha x^\alpha | c_\alpha \in k \} \text{ series need not converge}$$

variety V

$k[x_1 \dots x_n] / \mathbf{I}(V)$ variety V

18.2. Multiplicities and Milnor Numbers.
if I ideal in $k[x_1 \dots x_n]$, then denote $Ik[x_1 \dots x_n]_{\langle x_1 \dots x_n \rangle}$ ideal generated by I
in larger ring $k[x_1 \dots x_n]_{\langle x_1 \dots x_n \rangle}$

Definition 47 (2.1). *Let I 0-dim. ideal in $k[x_1 \dots x_n]$, so $V(I)$ consists of finitely many pts. in k^n.*
Assume $(0 \dots 0) \in V(I)$
☐ *multiplicity of $(0 \dots 0) \in V(I)$ is*

$$dim_k k[x_1 \dots x_n]_{\langle x_1 \dots x_n \rangle} / Ik[x_! \dots x_n]_{\langle x_1 \dots x_n \rangle}$$

generally, if $p = (a_1 \dots a_n) \in V(I)$
multiplicity of p, $m(p) = \dim k[x_1 \dots x_n]_M / Ik[x_1 \dots x_n]_M$

$$\dim k[x_1 \dots x_n]_M / Ik[x_1 \dots x_n]_M$$

localizing $k[x_1 \dots x_n]$ at maximal ideal $M = I(\{p\}) = \langle x_1 - a_1 \dots x_n - a_n \rangle$

20.

21. Polytopes, Resultants, and Equations

22. Polyhedral Regions and Polynomials

22.1. Integer Programming. Prop. 1.12.

Suppose 2 customers A, B ship to same location
A: ship 400 kg pallet taking up $2\,m^3$ volume
B: ship 500 kg pallet taking up $3\,m^3$ volume

ERNEST YEUNG ERNESTYALUMNI@GMAIL.COM

shipping firm trucks carry up to 3700 kg, up to $20\,m^3$

B's product more perishable, paying \$ 15 per pallet

A pays \$ 11 per pallet
How many pallets from A, B each in truck to maximize revenues?

$$
(1.1) \qquad
\begin{aligned}
4A + 5B &\leq 37 \\
2A + 3B &\leq 20 \\
A, B &\in \mathbb{Z}_{\geq 0}^{*}
\end{aligned}
$$

(37)

maximize $11A + 15B$

integer programming.
max. or min. value of some linear function

$$
l(A_1 \dots A_n) = \sum_{i=1}^{n} c_i A_i
$$

on set $(A_1 \dots A_n) \in \mathbb{Z}_{\geq 0}^{n}$ s.t.

3. Finally, by introducing additional variables; rewrite linear constraint inequalities as equalities. The new variables are called "slack variables"

$$
(1.4) \qquad a_{ij} A_j = b_i, \quad A_j \in \mathbb{Z}_{\geq 0}
$$

(38)

introduce indeterminate z_i, $\forall$ equation in (1.4)

$$
z_i^{a_{ij} A_j} = z_i^{b_i}
$$

m constraints

$$
\prod_{i=1}^{m} z_i^{a_{ij} A_j} = \prod_{i=1}^{m} z_i^{b_i} = \left(\prod_{i=1}^{m} z_i^{a_{ij}} \right)^{A_j}
$$

Proposition 17 (1.6). *Let k field, define $\varphi : k[w_1 \dots w_n] \to k[z_1 \dots z_m]$ by*

$$
\varphi(w_j) = \prod_{i=1}^{m} z_i^{a_{ij}} \qquad \forall j = 1 \dots n
$$

and

$$
\varphi(g(w_1 \dots w_n)) = g(\varphi(w_1) \dots \varphi(w_n))
$$

$\forall$ *general polynomial* $g \in k[w_1 \dots w_n]$
Then $(A_1 \dots A_n)$ *integer pt. in feasible region iff* $\varphi : w_1^{A_1} \dots w_n^{A_n} \mapsto z_1^{b_1} \dots z_m^{b_m}$

Exercise 3.
Now

$$
\varphi(w_j) = \prod_{i=1}^{m} z_i^{a_{ij}}
$$

$$
z_i^{a_{ij} A_j} = z_i^{b_i}
$$

If $(A_1 \dots A_n)$ an integer pt. in feasible region, $a_{ij} A_j = b_i$

$$
z_i^{a_{ij} A_j} = z_i^{b_i} = \prod_{j=1}^{n} z_i^{a_{ij} A_j} \Longrightarrow \prod_{j=1}^{n} \prod_{i=1}^{m} (z_i^{a_{ij}})^{A_j} = \prod_{i=1}^{m} z_i^{b_i} = \prod_{j=1}^{n} \varphi(w_j)^{A_j} = \prod_{j=1}^{n} \varphi(w_j)^{A_j} = \varphi \left(\prod_{j=1}^{n} w_j^{A_j} \right) = \prod_{i=1}^{m} z_i^{b_i}
$$

since $\varphi(g(w_1 \dots w_n)) = g(\varphi(w_1) \dots \varphi(w_n))$

If $\varphi : \prod_{j=1}^{n} w_j^{A_j} \mapsto \prod_{i=1}^{m} z_i^{b_i}$

$$
\varphi \left(\prod_{j=1}^{n} w_j^{A_j} \right) = \prod_{j=1}^{n} (\varphi(w_j))^{A_j} = \prod_{i=1}^{m} z_i^{b_i} = \prod_{j=1}^{n} \left(\prod_{i=1}^{m} z_i^{a_{ij}} \right)^{A_j} \Longrightarrow \prod_{j=1}^{n} z_i^{a_{ij} A_j} = z_i^{b_i}
$$

or $a_{ij} A_j = b_i$. So $(A_1 \dots A_n)$ integer pt.

Exercise 4.

$$
\prod_{i=1}^{m} z_i^{b_i} = \prod_{i=1}^{m} \prod_{j=1}^{n} z_i^{a_{ij} A_j} = \prod_{j=1}^{n} \left(\prod_{i=1}^{m} z_i^{a_{ij}} \right)^{A_j} = \prod_{j=1}^{n} \varphi(w_j)^{A_j} = \varphi \left(\prod_{j=1}^{n} w_j^{A_j} \right)
$$

So if given $(b_1 \dots b_m) \in \mathbb{Z}^m$, and for a given a_{ij}, $a_{ij} A_j = b_i$

For $m \leq n$, then a_{ij} is surjective, so $\exists A_j$ s.t. $\prod_{i=1}^{m} z_i^{b_i} = \varphi \left(\prod_{j=1}^{n} w_j^{A_j} \right)$

Proposition 18 (1.8). *Suppose $f_1 \dots f_n \in k[z_1 \dots z_m]$ given*
Fix monomial order in $k[z_1 \dots z_n, w_1 \dots w_n]$ with elimination property:
$\forall$ monomial containing 1 of z_i greater than any monomial containing only w_j

Let $\mathcal{G}$ Gröbner basis for ideal

$$
I = \langle f_1 - w_1 \dots f_n - w_n \rangle \subset k[z_1 \dots z_m, w_1 \dots w_n]
$$

$\forall f \in k[z_1 \dots z_m]$, let $\overline{f}^{\mathcal{G}}$ be remainder on division of f by $\mathcal{G}$
Then

(a) *polynomial f s.t. $f \in k[f_1 \dots f_n]$ iff $g = \overline{f}^{\mathcal{G}} \in k[w_1 \dots w_n]$*

(b) *if $f \in k[f_1 \dots f_n]$ as in part (a),*
    $g = \overline{f}^{\mathcal{G}} \in k[w_1 \dots w_n]$
    then $f = g(f_1 \dots f_n)$, giving an expression for f as polynomial in f_j

(c) *if $\forall f_i, f$ monomials, $f \in k[f_1 \dots f_n]$,*
    then g also a monomial.

Part 4. **Statistical Mechanics: Ising Model**

25. Ising Model

25.1. **Definition of Ising Model.** cf. Wikipedia, "Ising model"

Consider set of lattice sites Λ, each with set of adjacent sites (e.g. **graph**) forming d-dim. lattice.

$\forall$ lattice site $k \in \Lambda$, $\exists$ discrete variable σ_k, s.t. $\sigma_k \in \{-1, 1\}$.

spin configuration $\equiv \sigma = (\sigma_k)_{k \in \Lambda}$ is an assignment of spin value to each lattice site.

i.e.

$d = 1$, consider "line" configuration: $i \in \mathbb{Z}$, $i = 0, 1, \ldots L - 1$. Lattice site $k \in \Lambda = \Lambda_{d=1}$. $\forall k \in \Lambda$,
$\exists$ bijection to its index i, $k \mapsto i$, and $\exists \sigma_k$ i.e.

$$\sigma : \Lambda \leftrightarrow \sigma : \mathbb{Z} \to \mathbb{Z}_2$$
$$\sigma(k) \equiv \sigma_k \leftrightarrow \sigma(i) \equiv \sigma_i \mapsto \{-1, 1\}$$

spin configuration $\sigma : \Lambda \mapsto (\sigma_k)_{k \in \Lambda} \in \{-1, 1\}^{|\Lambda|}$, where $|\Lambda| = L$.
$\forall k \in \Lambda$, $\exists!$ only at most 2 edges, given, for $k \mapsto i$, $i + 1, i - 1$, $\forall i = 1 \ldots L - 2$.

$d = 2$, "rectangle" configuration. $(i, j) \in \mathbb{Z}^2$. $i \in 0, 1, \ldots L_x - 1$. Lattice site $\mathbf{k} \in \Lambda = \Lambda_{d=2}$.
$$j \in 0, 1, \ldots L_y - 1$$
$\forall \mathbf{k} \in \Lambda$, $\exists$ bijection to its "grid coordinates" (i, j), $\mathbf{k} \mapsto (i, j)$, and $\exists \sigma_{\mathbf{k}}$ i.e. $\sigma_{\mathbf{k}} = \sigma_{ij} \in \{-1, 1\}$.
spin configuration $\sigma : \Lambda \mapsto (\sigma_{\mathbf{k}})_{\mathbf{k} \in \Lambda} \in \{-1, 1\}^{|\Lambda|}$, where $|\Lambda| \equiv |\Lambda_{d=2}| = L_x L_y$.

$\forall \mathbf{k} \in \Lambda$, $\exists!$ only at most 4 edges, given by $\mathbf{k} \mapsto (i, j), (i \pm 1, j), (i, j \pm 1)$, $\quad i = 1 \ldots L_x - 2$.
$$j = 1 \ldots L_y - 2$$

Note that in both cases, I haven't yet defined the boundary conditions, and leave that to be discussed thoroughly in the future (i.e. following sections).

There are $2^{|\Lambda|}$ number of configurations in any dim. d.

cf. Wikipedia, "Ising model"

25.1.1. *Interaction $J_{ij} \equiv J_{\mathbf{kl}}$, Hamiltonian (energy functional) for a configuration $H(\sigma)$.* $\forall$ 2 adjacent (lattice) sites, $i, j \equiv \mathbf{k}, \mathbf{l} \in$

Λ, let there be an interaction $J_{ij} \equiv J_{\mathbf{kl}}$ i.e. $\quad J : \Lambda^2 \to \mathbb{R}$.
$$J : (\mathbf{k}, \mathbf{l}) \mapsto J_{\mathbf{kl}}$$
Adjacent means $\exists$ edge $\mathbf{k} \mapsto \mathbf{l}$ (the mapping is the edge)

Suppose $\forall$ site $j \equiv \mathbf{l} \in \Lambda$, $\exists$ external magnetic field $h_j \equiv h_{\mathbf{l}}$ interacting with it.
Given (site) configuration $\sigma : \Lambda \mapsto (\sigma_{\mathbf{k}})_{\mathbf{k} \in \Lambda} \in \{-1, 1\}^{|\Lambda|}$.

(39)
$$H(\sigma) = -\sum_{\langle ij \rangle} J_{ij} \sigma_i \sigma_j - \mu \sum_j h_j \sigma_j \equiv H(\sigma(\Lambda)) = -\sum_{\langle \mathbf{kl} \rangle} J_{\mathbf{kl}} \sigma_{\mathbf{k}} \sigma_{\mathbf{l}} - \mu \sum_{\mathbf{k} \in \Lambda} h_{\mathbf{k}} \sigma_{\mathbf{k}}$$

where $\sum_{\langle \mathbf{kl} \rangle}$ is overall pairs of adjacent spins (every pair is counted once),
$\langle \mathbf{k}, \mathbf{l} \rangle \equiv$ sites $\mathbf{k}, \mathbf{l}$ are nearest neighbors.

Note sign in 2nd. term, $-\mu \sum_{\mathbf{k}} h_{\mathbf{k}} \sigma_{\mathbf{k}}$ should be positive because of electron's magnetic moment is antiparallel to its spin, but negative term used conventionally.

Nothing was said about boundary conditions, I propose that it can be either fixed in the summation or by setting $J_{\mathbf{kl}} = 0$.

$\forall \mathbf{k} \in \Lambda$, let $\mathbf{y} : \Lambda \to E$, with $\{\langle \mathbf{k}, \mathbf{l} \rangle\}_{\mathbf{l}}$ be set of all edges from $\mathbf{k}$
$$\mathbf{y} : \mathbf{k} \mapsto \{\langle \mathbf{k}, \mathbf{l} \rangle_{\mathbf{l}}$$
Then clearly $\sum_{\langle \mathbf{kl} \rangle} = \frac{1}{2} \sum_{\mathbf{k} \in \Lambda} \sum_{\{\langle \mathbf{kl} \rangle\}_{\mathbf{l}}}$.

Taking into account only interaction between adjoining dipoles, on a square lattice:

$$E(\sigma) = -J \sum_{k,l=0}^{L-1} (\sigma_{kl} \sigma_{k,l+1} + \sigma_{kl} \sigma_{k+1,l})$$

cf. Landau and Lifshitz [6]

EY : 20171223 Things to check from Hjorth-Jensen (2015) [7]:

2-dim. Ising model, with $\mathcal{B} \equiv h_j = 0$, undergoes phase transition of 2nd. order: meaning below given critical temperature T_C, there's spontaneous magnetization with $\langle \mathcal{M} \rangle \equiv \langle \mathbf{M} \rangle \neq 0$. $\langle \mathbf{B} \rangle \to 0$ at T_C with *infinite* slope, a behavior called *critical phenomena*. Critical phenomenon normally marked by 1 or more thermodynamical variables which is 0 above a critical point. In this case, $\langle \mathbf{B} \rangle \neq 0$, such a parameter normally called *order parameter*.

Critical phenomena; we still don't have a satisfactory understanding of system's properties close to the critical point, even for simplest 3-dim. systems. Even mean-field models can predict wrong physics; mean-field theory results in a 2nd.-order phase transition for 1-dim. Ising model, wherea 1-dim. Ising model doesn't predict any spontaneous magnetization at any finite temperature T.

e.g. Consider 1-dim. N-spin system. Assume periodic boundary conditions. Consider state of all spins up, with total energy $-NJ$ and magnetization N. Flip half of spins (e.g. all spins of index $i > N/2$) so 1st half of spins point upwards and last half points downwards. Energy is $-NJ + 4J$, net magnetization 0. This is an example of a possible disordered state with net magnetization 0. Change in energy is too small to stabilize disordered state (to $-NJ$).

Definition 48 (configuration probability). *configuration probability* $P_\beta(\sigma)$ *given by Boltzmann distribution:*

(40)
$$P_\beta(\sigma) = \frac{\exp(-\beta H(\sigma))}{Z_\beta} = \text{ prob. of configuration } \sigma \equiv \sigma(\Lambda) \equiv (\sigma_{\mathbf{k}})_{\mathbf{k} \in \Lambda}$$

with the partition function as normalization constant Z_β:

(41)
$$Z_\beta = \sum_\sigma \exp -\beta H(\sigma)$$

cf. pp. 504 Sec. 151 Phase transitions of the second kind in a 2-dim. lattice, Landau and Lifshitz [6]

(42)
$$Z = 2^N (1 - x^2)^{-N} \prod_{p,q=0}^{L-1} \left[(1 + x^2)^2 - 2x(1 - x^2) \left(\cos \frac{2\pi p}{L} + \cos \frac{2\pi q}{L} \right) \right]^{1/2}$$

cf. (151.11) of Landau and Lifshitz [6], where $x = \tanh \theta$, $\theta = J/T \equiv J/\tau = \beta J$.

$$\Phi \equiv F = -\tau \ln Z =$$

(43)
$$= -\tau N \ln 2 + \tau N \ln (1 - x^2) - \frac{\tau}{2} \sum_{p,q=0}^{L} \ln \left[(1 + x^2)^2 - 2x(1 - x^2) \left(\cos \frac{2\pi p}{L} + \cos \frac{2\pi q}{L} \right) \right]$$

Let $\omega_1 = \frac{2\pi p}{L}$ with $p \to 0$ as $L \to \infty$ so $\frac{L d\omega_1}{2\pi} = dp$ and using $L^2 = N$.

$\omega_2 = \frac{2\pi q}{L}$ with $q \to 0$ as $L \to \infty$ $\quad \frac{L d\omega_2}{2\pi} = dq$

$$\Phi = -\tau N \ln 2 + \tau N \ln (1 - x^2) - \frac{N\tau}{2(2\pi)^2} \int_0^{2\pi} \int_0^{2\pi} d\omega_1 d\omega_2 \ln \left[(1 - x^2) - 2x(1 - x^2)(\cos \omega_1 + \cos \omega_2) \right]$$

$F \equiv \Phi$ has singularity when $(1 - x^2) - 2x(1 - x^2)(\cos \omega_1 + \cos \omega_2)$ in $\ln\left[(1 - x^2) - 2x(1 - x^2)(\cos \omega_1 + \cos \omega_2)\right]$.
$(1 - x^2) - 2x(1 - x^2)(\cos \omega_1 + \cos \omega_2)$ minimized when $\cos \omega_1 = \cos \omega_2 = 1$ (since $-1 < x < 1$)

$$\implies (1 + x^2)^2 - 4x(1 - x^2) = 1 + 2x^2 + x^4 - 4x + 4x^3 = (x^2 + 2x - 1)^2 = 0 \implies x = \frac{-2 \pm \sqrt{4 - 4(-1)}}{2} = -1 + \sqrt{2}$$

$$e^\theta - e^{-\theta} = \sqrt{2}e^\theta + \sqrt{2}e^{-\theta} - e^\theta - e^{-\theta} \text{ so}$$

$$x = \tanh \theta = \frac{e^\theta - e^{-\theta}}{e^\theta + e^{-\theta}} = \sqrt{2} - 1 \text{ or}$$

$$(2 - \sqrt{2})e^\theta = \sqrt{2}e^{-\theta}$$

$$e^{2\theta} = \frac{\sqrt{2}}{2 - \sqrt{2}}\left(\frac{2 + \sqrt{2}}{2 + \sqrt{2}}\right) \text{ or}$$

$$2\theta = \ln(1 + \sqrt{2})$$

$$\frac{J}{T_c} = \frac{1}{2}\ln(1 + \sqrt{2}) \text{ or}$$

(44)
$$\boxed{\tau_c = \frac{2J}{\ln(1 + \sqrt{2})}}$$

so that $\tau_C \equiv T_C$ is where phase transition occurs.
Let $t := \tau - \tau_c$. $\theta = \frac{J}{\tau} = \frac{J}{t + \tau_C}$
Expand about minimum
EY:20171230 do this explicitly

$$\int_0^{2\pi}\int_0^{2\pi} d\omega_1 d\omega_2 \ln[c_1 t^2 + c_2(\omega_1^2 + \omega_2^2)]$$

$$F \equiv \Phi \simeq a + \frac{1}{2}b(\tau - \tau_c)^2 \ln|\tau - \tau_c|$$

$$C = \frac{\partial^2 F}{\partial \tau} \simeq -b\tau_c \ln|\tau - \tau_c|$$

with C being heat capacity.

Order parameter $\langle M \rangle \equiv \eta = \text{constant}(\tau_c - \tau)^{1/8} = \begin{cases} 0 & \text{if } \tau > \tau_c \\ \text{constant } (\tau_c - \tau)^{1/8} & \text{if } \tau < \tau_c \end{cases}$

cf. pp. 505 Sec. 151 Phase transitions of the second kind in a 2-dim. lattice, Landau and Lifshitz [6], L.Onsager 1947.

25.2. An actual calculation of a small number of spins with Ising model.
Sec. 3.7 "An actual calculation" on pp. 76 of Newman and Barkema (1999) [8] goes through a simple actual Monte Carlo calculation as a test case check so to compare this exact calculation/solution to the simulation, as a test of whether the simulation/program is correct. This is done in Sec. 1.3 of Newman and Barkema (1999) [8].

However, none of these promised simple calculations were shown explicitly in Newman and Barkema (1999) [8]. I will forego this simple case.

25.3. Explicit calculation showing stencil operation on each spin on a periodic lattice grid.
Consider

$$H(\sigma) = -\sum_{\langle \mathbf{kl} \rangle} J\sigma_{\mathbf{k}}\sigma_{\mathbf{l}} = -J\sum_{i=0}^{L_x-1}\sum_{j=0}^{L_y-1}\sigma_{ij}(\sigma_{i+1j} + \sigma_{ij+1}) =$$

$$= \frac{-J}{2}\left(\sum_{i=0}^{L_x-1}\sum_{j=0}^{L_y-1}\sigma_{ij}(\sigma_{i+1j} + \sigma_{ij+1}) + \sum_{i=1}^{L_x}\sum_{j=0}^{L_y-1}\sigma_{i-1j}(\sigma_{ij} + \sigma_{i-1j+1})\right) =$$

$$= \frac{-J}{2}\left(\sum_{i=0}^{L_x-1}\sum_{j=0}^{L_y-1}\sigma_{ij}(\sigma_{i+1j} + \sigma_{ij+1}) + \sum_{i=1}^{L_x}\sum_{j=0}^{L_y-1}\sigma_{i-1j}\sigma_{ij} + \sum_{i=0}^{L_x-1}\sum_{j=1}^{L_y}\sigma_{ij-1}\sigma_{ij}\right)$$

Now for each of these terms,

$$\sum_{i=1}^{L_x}\sum_{j=0}^{L_y-1}\sigma_{i-1j}\sigma_{ij} = \sum_{i=1}^{L_x}\left(\sum_{j=1}^{L_y-1}\sigma_{i-1j}\sigma_{ij} + \sigma_{i-10}\sigma_{i0}\right) = \sum_{i=1}^{L_x-1}\left(\sum_{j=1}^{L_y-1}\sigma_{i-1j}\sigma_{ij} + \sigma_{i-10}\sigma_{i0}\right) + \left(\sum_{j=1}^{L_y-1}\sigma_{L_x-1j}\sigma_{L_xj}\right) + \sigma_{L_x-10}\sigma_{L_x0}$$

$$\sum_{i=0}^{L_x-1}\sum_{j=1}^{L_y}\sigma_{ij-1}\sigma_{ij} = \sum_{j=1}^{L_y-1}\left(\sum_{i=1}^{L_x-1}\sigma_{ij-1}\sigma_{ij} + \sigma_{0j-1}\sigma_{0j}\right) + \sum_{i=1}^{L_x-1}\sigma_{iL_y-1}\sigma_{iL_y} + \sigma_{0L_y-1}\sigma_{0L_y}$$

$$\sum_{i=0}^{L_x-1}\sum_{j=0}^{L_y-1}\sigma_{ij}(\sigma_{i+1j} + \sigma_{ij+1}) = \sum_{i=0}^{L_x-1}\left(\sum_{j=1}^{L_y}\sigma_{ij}(\sigma_{i+1j} + \sigma_{ij+1}) + \sigma_{i0}(\sigma_{i+10} + \sigma_{i1})\right) =$$

$$\sum_{i=1}^{L_x-1}\left(\sum_{j=1}^{L_y-1}\sigma_{ij}(\sigma_{i+1j} + \sigma_{ij+1}) + \sigma_{i0}(\sigma_{i+10} + \sigma_{i1})\right) + \sum_{j=1}^{L_y-1}\sigma_{0j}(\sigma_{1j} + \sigma_{0j+1}) + \sigma_{00}(\sigma_{10} + \sigma_{01})$$

Apply periodic boundary conditions. Adding up all the terms above, clearly we obtain 1 term which shows the stencil operation for spins on the "interior" of the grid:

$$\sum_{i=1}^{L_x-1}\sum_{j=1}^{L_y-1}\sigma_{ij}(\sigma_{i+1j} + \sigma_{ij+1} + \sigma_{i-1j} + \sigma_{ij-1})$$

and if we apply *periodic* boundary conditions, neatly, we'll see all the lattice sites at the boundary also will have this stencil operation:

$$\sum_{i=1}^{L_x-1}\sigma_{i0}(\sigma_{i+10} + \sigma_{i1}) + \sum_{j=1}^{L_y-1}\sigma_{0j}(\sigma_{1j} + \sigma_{0j+1}) + \sigma_{00}(\sigma_{10} + \sigma_{01}) + \left(\sum_{i=1}^{L_x-1}\sigma_{iL_y-1}\sigma_{i0}\right) + \sigma_{0L_y-1}\sigma_{00} + \sum_{j=1}^{L_y-1}\sigma_{0j-1}\sigma_{0j} +$$

$$+ \sum_{j=1}^{L_y-1}\sigma_{L_x-1j}\sigma_{0j} + \sigma_{L_x-10}\sigma_{00} + \sum_{i=1}^{L_x-1}\sigma_{i-10}\sigma_{i0}$$

Now, we can obtain the following for Hamiltonian, given spin configuration σ with a lattice grid obeying periodic conditions:

$$H(\sigma) = -\frac{J}{2} \sum_{i=0}^{L_x-1} \sum_{j=0}^{L_y-1} \sigma_{ij}(\sigma_{i+1j} + \sigma i - 1j + \sigma_{ij+1} + \sigma_{ij-1}) =$$

(45)

$$= \frac{-J}{2} \left[\sum_{i=0}^{L_x-1} \left(\sum_{\substack{j=0 \\ j \neq j'}}^{L_y-1} \sigma_{ij}(\sigma_{i+1j} + \sigma_{i-1j} + \sigma_{ij+1} + \sigma_{ij-1}) + \sigma_{ij'}(\sigma_{i+1j'} + \sigma_{i-1j'} + \sigma_{ij'+1} + \sigma_{ij'-1}) \right) + \right.$$

$$\left. \sum_{\substack{j=0 \\ j \neq j'}}^{L_y-1} \sigma_{i'j}(\sigma_{i'+1j} + \sigma_{i'-1j} + \sigma_{i'j+1} + \sigma_{i'j-1}) + \sigma_{i'j'}(\sigma_{i'+1j'} + \sigma_{i'-1j'} + \sigma_{i'j'+1} + \sigma_{i'j'-1}) \right]$$

Consider a psin flip of $\sigma_{i'j'}$. Contribution to ΔH at stencil operation on $\sigma_{i'j'}$, at $(i'j') \in \Lambda$, is

$$\frac{-J}{2}(-\sigma_{i'j'} - \sigma_{i'j'})(\sigma_{i'+1j'} + \sigma_{i'-1j'} + \sigma_{i'j'+1} + \sigma_{i'j'-1}) = J\sigma_{i'j'}(\sigma_{i'+1j'} + \sigma_{i'-1j'} + \sigma_{i'j'+1} + \sigma_{i'j'-1})$$

Consider $\sigma_{i'j'}\sigma_{i'+1j'}$. Clearly, term $\sigma_{i-1j}\sigma_{ij'}$ with $i = i' + 1$ only occurs once more in the summation. Thus, we can definitely conclude that for $\Delta H \equiv \Delta H(\Delta \sigma_{i'j'})$ due to a single spin-flip is

(46)
$$\Delta H(\Delta \sigma_{i'j'}) = 2J\sigma_{i'j'}(\sigma_{i'+1j'} + \sigma_{i'-1j'} + \sigma_{i'j'+1} + \sigma_{i'j'-1})$$

https://www.colorado.edu/physics/phys7240/phys7240_fa12/notes/Week3.pdf Victor Gurarie, Advanced Statistical Mechanics, Fall 2012 Exact solution by transfer matrices for 2-dim. Ising model.

Part 5. Conformal Field Theory; Virasoro Algebra

cf. Schottenloher (2008) [5]

26. Conformal Transformations

Definition 49 (Conformal transformation or conformal map). *Let 2 semi-Riemannian manifolds*(M,g), (M',g'), $dimM = dimM'$, *let open* $U \subset M$, *open* $V \subset M'$.

*   **conformal transformation** or **conformal map** is a smooth $\varphi : U \to V$ of maximal rank, if $\exists$ smooth $\Omega : U \to \mathbb{R}^+$ s.t.*

(47)
$$\varphi^* g' = \Omega^2 g$$

where $\varphi * g'(X,Y) := g'(T\varphi(X), T\varphi(Y))$ and $T\varphi : TU \to TV$ denote tangent map (derivative) of φ.

$\Omega \equiv$ conformal factor *of φ.*

Locally, $y^i = \varphi^i(x)$,

$$\frac{\partial \varphi^i}{\partial x^j} = \frac{\partial y^i}{\partial x^j}$$

Then

$$X = X^k \frac{\partial}{\partial x^k} = X^k \frac{\partial y^i}{\partial x^k} \frac{\partial}{\partial y^i} = X^k \frac{\partial \varphi^i}{\partial x^k} \frac{\partial}{\partial y^k} \in TM$$

and so

$$\varphi^* g'(X,Y) = g'(T\varphi(X), T\varphi(Y)) = (g')_{ij} X^k \frac{\partial y^i}{\partial x^k} Y^l \frac{\partial y^j}{\partial x^l} = (g')_{ij} X^k \frac{\partial \varphi^i}{\partial x^k} Y^l \frac{\partial y^j}{\partial x^l}$$

$$\implies (\varphi^* g')_{kl} = (g')_{ij} \frac{\partial y^i}{\partial x^k} \frac{\partial y^j}{\partial x^l}$$

$$\implies (\varphi^* g')_{kl} = (g')_{ij} \frac{\partial \varphi^i}{\partial x^k} \frac{\partial \varphi^j}{\partial x^l} = \Omega^2 g_{kl}$$

Definition 50. **extension** *of G by group A is (given by) an exact sequence of group homomorphisms.*

$$1 \longrightarrow A \xrightarrow{i} E \xrightarrow{\pi} G \longrightarrow 1$$

cf. Def. 3.1 of Schottenloher (2008) [5].

Recall that an exact sequence, if
$$\begin{aligned} \mathrm{im}(1 \to A) &= \ker(i) \\ \mathrm{im}(i) &= \ker(\pi) \\ \mathrm{im}(\pi) &= \ker(G \to 1) \end{aligned}$$

By Thm., $1 \to A \xrightarrow{i} E$ exact so i injective.
$E \xrightarrow{\pi} G \to 1$ exact so π surjective.

Extension is called **central** if A abelian and image im$i$ is in center of E, i.e. $a \in A, b \in E \implies i(a)b = bi(a)$.

26.0.1. *Examples of extensions of G, and central extensions of G (which has a particular E).*

*   e.g. central extension has form

$$1 \longrightarrow A \xrightarrow{i} A \times G \xrightarrow{\mathrm{pr}_2} G \longrightarrow 1$$

where
$i : A \to A \times G$
$a \mapsto (a,1)$

$$i(a)(a',g) = (a,1)(a',g) = (aa',g) =$$
$$= (a'a, g \cdot 1) = (a',g)(a,1) = (a',g)i(a)$$

Notice that what the *exactness* property of an exact sequence does:

$$\mathrm{pr}_2 i(a) = \mathrm{pr}_2(a,1) = 1$$

*   e.g. of a nontrivial central extension is exact sequence

$$1 \longrightarrow \mathbb{Z}/k\mathbb{Z} \longrightarrow E \times U(1) \xrightarrow{\pi} U(1) \longrightarrow 1$$

(48)

with $\pi(z) = z^k \quad \forall k \in \mathbb{N}, \, k \geq 2$, since $E = U(1)$ and $\mathbb{Z}/k\mathbb{Z}$ are not isomorphic.

Also, homomorphism $\tau : U(1) \to E$ with $\pi \circ \tau = 1_{U(1)}$, doesn't exist, since there's no global kth root.

EY : 20170926 It's that in integer division of the argument in a complex number $z \in U(1)$, and exponent multiplication by k, you go from 1 to many and many to 1, depending upon the "branch" you're mapping to for complex numbers.

For $[n] \in \mathbb{Z}/k\mathbb{Z}$,

$$[n] \xrightarrow{i} \exp\left(\frac{[n]}{k} 2\pi i\right)$$

and so

$$\ker\pi = \{z | \pi(z) = 1\} \text{ so that } \ker\pi = \{z = \exp\left(\frac{i2\pi n}{k}\right)\}$$

*   e.g. *Semidirect products.*
    group G acting on another group H, by homomorphism

$$\tau : G \to \mathrm{Aut}(H)$$

Definition 51 (semi-direct product). **semidirect product** *group $G \ltimes H$ is set $H \times G$, with multiplication*
$$(x,g) \cdot (x',g') := (x\tau(g)(x'), gg') \qquad \forall (x,g),(x',g') \in H \times G$$

(49)
$$1 \longrightarrow H \overset{i}{\longrightarrow} G \ltimes H \overset{\pi}{\longrightarrow} G \longrightarrow 1$$

with

(50)
$$i : H \to G \ltimes H$$
$$i(x) = (x, 1)$$

i group homomorphism, since

(51)
$$i(x_1 x_2) = (x_1 x_2, 1) = (x_1 \tau(1) x_2, 1) = (x_1, 1) \cdot (x_2, 1) = i(x_1) i(x_2)$$

$$\pi : G \ltimes H \to G$$
$$\pi(x, g) = g$$

cf. http://sierra.nmsu.edu/morandi/oldwebpages/math683fall2002/GroupExtensions.pdf

Observe that
$$\pi i(x) = \pi(x, 1) = 1 \text{ so } \ker \pi = \operatorname{im} i$$

Definition 52 (Semi-direct product (2); with direct product). *direct product* $G = HK$ *if* H, K *subgroups of group* G, *s.t.*

- H *and* K *are normal in* G $(gkg^{-1} \in K \quad \forall g \in G, \forall k \in K)$
- $H \cap K = \{1\}$
- $HK = G$.
  semi-direct product. *Relax the 1st condition (of direct products) so* H *still normal in* G, *but* K *need not be.*

- H *normal in* G $(ghg^{-1} \in H, \forall g, \forall h \in H)$
- $H \cap K = \{1\}$
- $HK = G$

Connection between Def. 51 *and* Def. 52 *for the* semidirect product: Consider $\tau : G \to \operatorname{Aut}(H)$.
Consider $G \ltimes H$ - what is the identity $1_{G \ltimes H} \equiv (1_H, 1_G)$ of this group?
$$(x, g) \cdot (1_H, 1_G) = (x\tau(g)1_H, g1_G) = (x\tau(g)1_H, g) \Longrightarrow 1_H = \tau(g^{-1})1, \ 1_G = 1$$
and so the inverse, $\forall (x, g) \in G \ltimes H, (x, g)^{-1} \equiv ((x^{-1}), (g^{-1}))$,
$$(x, g)(x, g)^{-1} = (x\tau(g)(x^{-1}), g(g^{-1})) = (x\tau(g)(x^{-1}), 1) \text{ (if } (g^{-1}) = g^{-1})$$
Moving along,
$$x\tau(g)(x^{-1}) = \tau(g^{-1})1$$
$$\Longrightarrow (x^{-1}) = \tau(g^{-1})x^{-1}\tau(g^{-1})1$$
Checking out the H being a normal subgroup of $G \ltimes H$ condition, i.e. $H \triangleleft G$,
$$(x, g)(h, 1)(\tau(g^{-1})x^{-1}\tau(g^{-1}), g^{-1}) = (x\tau(g)h, g)(\tau(g^{-1})x^{-1}\tau(g^{-1}), g^{-1}) =$$
$$= (x\tau(g)h\tau(g)\tau(g^{-1})x^{-1}\tau(g^{-1}), 1) = (x\tau(g)hx^{-1}\tau(g^{-1}), 1)$$
$\Longrightarrow H$ normal subgroup of $G \ltimes H \equiv H \triangleleft (G \ltimes H)$.
Notes on Semidirect products
- extension

(52)
$$1 \longrightarrow SL(n, \mathbb{R}) \overset{i}{\longrightarrow} GL(n, \mathbb{R}) \overset{\det}{\longrightarrow} \mathbb{R}^* \longrightarrow 1$$

with
$$GL(n, \mathbb{R}) \equiv Gl_n(\mathbb{R}) = \{A | A \in \operatorname{Mat}_{\mathbb{R}}(n, n); \det A \neq 0\}$$
$$\det : GL(n, \mathbb{R}) \to \mathbb{R}^* \equiv \mathbb{R} \backslash \{0\}, \det \text{ surjective homomorphism}$$
$$SL(n, \mathbb{R}) \equiv Sl_n(\mathbb{R}) = \{A | A \in \operatorname{Mat}_{\mathbb{R}}(n, n); \det A = 1\}$$

Note that $\ker(\det) = SL(n, \mathbb{R})$.
Now
$$\mathbb{R}^* \simeq \{a1_n | a \in \mathbb{R}^*\}$$

and $\det(a1_n) = a^n$.
If n odd, and $\det(a1_n) = a^n = 1$, then $a = 1$. If n even, $a = \{-1, 1\}$.
By the second definition of a semi-direct product, Def. 52, it's required that $SL(n, \mathbb{R}) \cap \mathbb{R}^* = 1$ (i.e. the intersection is only the identity). This will only be the case if n odd.
cf. http://sierra.nmsu.edu/morandi/oldwebpages/math683fall2002/GroupExtensions.pdf

Part 6. Algebraic Topology

cf. Bredon (1997) [9]

27. Simplicial Complexes

cf. pp. 245, from Sec. 21 Simplicial Complexes of Ch. 4 Homology Theory in Bredon (1997) [9]
$\mathbf{v}_0, \dots \mathbf{v}_n \in \mathbb{R}^\infty$, "affinely independent" if they span an affine n-plane, i.e.
$$\text{if } \left(\sum_{i=0}^{n} \lambda_i \mathbf{v}_i = 0, \sum_{i=0}^{n} \lambda_i = 0\right), \text{ then } \Longrightarrow \forall \lambda_i = 0$$
If not, then, e.g. $\lambda_0 \neq 0$, assume $\lambda_0 = -1$, and solve the equations to get
$$\mathbf{v}_0 = \sum_{i=1}^{n} \lambda_i \mathbf{v}_i$$
$$\sum_{i=1}^{n} \lambda_i = 1$$
i.e. $\mathbf{v}_0$ is in affine space spanned by $\mathbf{v}_1 \dots \mathbf{v}_n$.
If $\mathbf{v}_0, \dots \mathbf{v}_n$ affinely independent, then

(53)
$$\sigma = (\mathbf{v}_0, \dots \mathbf{v}_n) = \{\sum_{i=0}^{n} \lambda_i \mathbf{v}_i | \sum_{i=0}^{n} \lambda_i = 1, \lambda_i \geq 0\}$$

is "affine simplex" spanned by $\mathbf{v}_i$; also convex hull of $\mathbf{v}_i$.
$\forall k \leq n$, k-face of σ is any affine simplex of form $(\mathbf{v}_{i_1}, \dots \mathbf{v}_{i_k})$, where vertices all distinct, so are affinely independent.

Definition 53. *(geometric) simplicial complex* $K :=$ *collection of affine simplices s.t.*

(1) $\sigma \in K \Longrightarrow$ *any face of* $\sigma \in K$; *and*
(2) $\sigma, \tau \in K \Longrightarrow \sigma \bigcap \tau$ *is a face of both* σ *and* τ, *or* $\sigma \bigcap \tau = \emptyset$
If K *simplicial complex,* $|K| = \bigcup \{\sigma | \sigma \in K\} \equiv$ *"polyhedron" of* K

Definition 54 (Def. 21.2 of Bredon (1997) [9]). *polyhedron := space* X *if* $\exists$ *homeomorphism* $h : |K| \overset{\approx}{\to} X$ *for some simplicial complex* K. h, K *is triangulation of* X; *(map* h, *complex* K)

Let K finite simplicial complex.

Choose ordering of vertices $\mathbf{v}_0, \mathbf{v}_1 \ldots$ of K.

If $\sigma = (\mathbf{v}_{\sigma_0}, \ldots \mathbf{v}_{\sigma_n})$ is simplex of K, where $\sigma_0 < \cdots < \sigma_n$, then

let $f_\sigma : \Delta_n \to |K|$ be

$$f_\sigma = [\mathbf{v}_{\sigma_b}, \ldots \mathbf{v}_{\sigma_n}]$$

in notation of Def. 1.2. Bredon (1997) [9].

Then this gives CW-complex structure on $|K|$ with f_σ as characteristic maps.

Part 7. Graphs, Finite Graphs

28. Graphs, Finite Graphs, Trees

Serre (1980) [10]

cf. Chapter I. Trees and Amalgams, Section 1 Amalgams, Subsection 1.1 Direct limits of Serre (1980) [10]

Let $(G_i)_{i \in I}$, family of groups.

$\forall$ pair (i, j), let $F_{ij} =$ set of homomorphisms of G_i into G_j

Want: group $G = \varinjlim G_i$ and

$$\{f_i | f_i : G_i \to G\} \text{s.t. } f_j \circ f = f_i \quad \forall f \in F_{ij}$$

group G and family $\{f_i\}$ universal in that

(*) if H group, if $\{h_i | h_i : G_i \to H; h_j \circ f = h_i \quad \forall f \in F_{ij}\}$,
then $\exists ! h : G \to H$ s.t. $h_i = h \circ f_i$

i.e. $\mathrm{Hom}(G, H) \simeq \varprojlim \mathrm{Hom}(G_i, H)$, the inverse limit being taken relative to F_{ij}.

i.e. G direct limit of G_i relative to the F_{ij}.

EY : 20170918 this is my rewrite/reinterpretation:

Let $(G_i)_{i \in I}$, $\forall (i, j) \in I^2$, let $F_{ij} = \{f \equiv f_{ij} | f : G_i \to G_j, f$ homomorphism of G_i into G_j $\}$.

Given group $G = \varinjlim G_i$ (for fixed i), $\{f_i | f_i : G_i \to G | f_j \circ f = f_i \quad \forall f \in F_{ij}\}$, i.e.

$$G_i \xrightarrow{\;\;f_i\;\;} G$$
$$f_{ij} \equiv f \searrow \;\; \downarrow f_j$$
$$G_j$$

Then $G, \{f_i | f_i : G_i \to G | f_j \circ f = f_i \quad \forall f \in F_{ij}\}$ **universal**

if $\forall$ group H, $\forall \{h_i | h_i : G_i \to H | h_j \circ f = h_i \quad \forall f \in F_{ij}\}$,

$$H \xleftarrow{h_i} G_i \xrightarrow{f_i} G$$
$$\exists ! h$$
$$h_j \quad f_{ij} \equiv f \downarrow \quad f_j$$
$$G_j$$

then $\exists ! \; h : G \to H$, s.t. $h_i = h \circ f_i$ i.e.

Proposition 19. $\exists !$ *pair G, family $(f_i)_{i \in I}$, i.e. (pair consisting of $G, (f_i)_{i \in I}$, unique up to unique isomorphism.*

Proof. Define G by generators and relations.

Take generating family to be disjoint union of those for G_i.

relations - xyz^{-1} where $x, y, z \in G_i$, $z = xy \in G_i$

xy^{-1} where $x \in G_i$, $y \in G_j$, $y = f(x)$ for at least $f \in F_{ij}$.

Thus, existence of $G, \{f_i\}$.

G represents functor $H \mapsto \varprojlim \mathrm{Hom}(G_i, H)$.

Thus, uniqueness (also from universal property). $\square$

e.g. groups A, G_1, G_2, homomorphisms $f_1 : A \to G_1$.

$$f_2 : A \to G_2$$

G obtained by amalgamating A in G_1, G_2 by $f_1, f_2 \equiv G_1 *_A G_2$.

1 can have $G = \{1\}$, even though f_1, f_2 non-trivial.

Application: (Van Kampen Thm.)

Let topological space X be covered by open U_1, U_2.

Suppose $U_1, U_2, U_{12} = U_1 \bigcap U_2$ arcwise connected.

Let basept. $x \in U_{12}$.

Then $\pi_1(X; x)$ obtained by taking 3 groups

$$\pi_1(U_1; x), \pi_1(U_2; x), \pi_1(U_{12}; x)$$

and amalagamating them according to homomorphism

$$\pi_1(U_{12}; x) \to \pi_1(U_1; x)$$
$$\pi_1(U_{12}; x) \to \pi_1(U_2; x)$$

Exercise 1. Let homomorphisms $f_1 : A \to G_1$ amalgam $G = G_1 *_A G_2$.

$$f_2 : A \to G_2$$

Define subgroups A^n, G_1^n, G_2^n, of A, G_1, G_2 recursively by

$$A^1 = \{1\}$$
$$G_1^1 = \{1\}$$
$$G_2^1 = \{1\}$$

$A^n =$ subgroup of A generated by $f_1^{-1}(G_1^{n-1})$ and $f_2^{-1}(G_2^{n-1})$

$$G_1^n = \text{subgroup of } G_i \text{ generated by } f_i(A^n)$$

Let A^∞, G_i^∞ be unions of A^n, G_i^n resp.

Show that f_i defines injection $A/A^\infty \to G_i/G_i^\infty$.

So the amalgamation is $G \simeq G_1/G_1^\infty *_{A/A^\infty} G_2/G_2^\infty$.

Take the first induction case (for intuition about the solution).

$$A^2 = \langle f_1^{-1}(G_1^1), f_2^{-1}(G_2^1) \rangle = \langle f_1^{-1}(\{1\}), f_2^{-1}(\{1\}) \rangle$$
$$G_i^2 = f_i(A^2)$$

Let $f_i(a) = f_i(b) \in G_i/G_i^\infty$; $a, b \in A/A^\infty$.

Then since $f_i(a), f_i(b) \in G_i/G_i^\infty$, $f_i(a), f_i(b) \in \{gG_i^\infty | g \in G_i\}$ (quotient is defined to be the set of all left cosets of G_i^∞, which has to be a normal subgroup for G_i/G_i^∞ to be a quotient group).

Since $a, b \in A/A^\infty$, suppose we take $a, b \in A$.

And suppose we take

$$f_i(a) = f_i(a)G_i^\infty = f_i(a)f_i(A^{n_a}) = f_i(aA^{n_a})$$
$$f_i(b) = f_i(b)G_i^\infty = f_i(b)f_i(A^{n_b}) = f_i(bA^{n_b})$$

Taking f_i^{-1} (recall for group homomorphisms, they map inverse of element of 1st. group to inverse of image of this element).

$aA^{n_a} = bA^{n_b} \in A/A^\infty$ (This is okay as we've "quotiented out A^∞; so indeed, they're equal)

cf. Subsection 1.2 Structure of amalgams of Serre (1980) [10]

Suppose given group A, family of groups $(G_i)_{i \in I}$, and, $\forall i \in I$, injective homomorphism $A \to G_i$.

$*_A G_i \equiv$ direct limit (cf. no. 1.1) of family (A, G_i) with respect to these homomorphisms, call it *sum* (in category theory sense, i.e. product) of G_i with A amalgamated.

e.g. $A = \{1\}$,

$*G_i \equiv$ free product of G_i.

28.0.1. *reduced word.* $\forall i \in I$, choose set S_i of right coset representatives of G_i modulo A,

assume $1 \in S_i$,

$(a, s) \mapsto as$ is bijection of $A \times S_i$ onto G_i,

$A \times (S_i - \{1\}) \to G_i - A$ (onto)

Let $\mathbf{i} = (i_1 \ldots i_n)$, $n \geq 0$, $i_j \in I$, s.t.

$$(54) \qquad\qquad i_m \neq i_{m+1} \text{ for } 1 \leq m \leq n-1$$

cf. (T) of Serre (1980) [10].

So *reduced word m* is defined as

$$m = (a; s_1 \ldots s_n)$$

where $a \in A$, $s_1 \in S_{i_1} \ldots s_n \in S_{i_n}$, and $s - j \neq 1 \forall j$.

$f \equiv$ canonical homomorphism of A into group $G = *_A G_i$

$f_i \equiv$ canonical homomorphism of G_i into group $G = *_A G_i$

EY : 20170611 (Further explanations, basic examples, from me):

Given $A, \{G_i\}_{i \in I}$, injective (group) homomorphisms $\{f_i : A \to G_i\}_i$.

$G_i \backslash f_i(A) = \{f_i(A)g | g \in G_i\}$.

Right coset representation of $f_i(A)g \mapsto g$.

e.g. A, G_1, G_2, $f_1 : A \to G_1$.

$\qquad\qquad f_2 : A \to G_2$

$$G_1 \backslash f_1(A) = \{f_1(A)g | g \in G_1\}$$
$$G_2 \backslash f_2(A) = \{f_2(A)g | g \in G_2\}$$

$\mathbf{i} = (i_1 \ldots i_n)$, $i_j \in I$, $i_m \neq i_{m+1}$ for $1 \leq m \leq n-1$.

Consider $(1212\ldots 12)$

$m = (a; f_1 g_2 f_3 g_4 \ldots f_{2n-1}, g_{2n})$ where f's $\in S_1 \subset G_1$, g's $\in S_2 \subset G_2$.

and so

Definition 55 (reduced word). ***reduced word*** *of type* $\mathbf{i}$, m,

$$(55) \qquad\qquad m = (a; s_1 \ldots s_n)$$

where $a \in A$, $s_1 \in S_{i_1}, \ldots s_n \in S_{i_n}$, $s_j \neq 1 \quad \forall j$,

$\mathbf{i} = (i_1 \ldots i_n)$, $i_j \in I$, *s.t.* $i_m \neq i_{m+1}$ *for* $1 \leq m \leq n-1$,

with $S_i = \{g | g \in f_i(A)g \in f_i(A)G_i\}$

Theorem 14 (1 of Serre (1980) [10]). $\forall g \in G$, $\exists$ *sequence* $\mathbf{i}$ *s.t.* $i_m \neq i_{m+1}$ *for* $1 \leq m \leq n-1$ *and*

reduced word

$$m = (a; s_1 \ldots s_n)$$

of type $\mathbf{i}$ *s.t.*

$$g = f(a) f_{i_1}(s_1) \ldots f_{i_n}(s_n)$$

Furthermore, $\mathbf{i}$ and m unique.

Remark. Thm. 1 implies $f; f_i$ injective.

Then identify A and G_i with images $f(A), f_i(G_i)$ in G, and reduced decomposition (*) of $g \in G$

$$g = a s_1 \ldots s_n, \quad a \in A, \ s_1 \in S_{i_1} - \{1\} \ldots s_n \in S_{i_n} - \{1\}$$

Likewise, $G_i \bigcap G_j = A$ if $i \neq j$.

In particular, $S_i - \{1\}$ pairwise disjoint in G.

Proof. Let $X_i \equiv$ set of reduced words of type $\mathbf{i}$, $X = \coprod X_i$.

Make G act on X.

In view of universal property of G, sufficient to make $\forall i, G_i$ act,

check action induced on A doesn't depend on i

Suppose then that $i \in I$, and let $Y_i =$ set of reduced words of form $(1; s_1 \ldots s_n)$, with $i_1 \neq i$.

EY : 20170611

Recall that

$$S_i = \{g | g \in f_i(A)g \in f_i(A)G_i\}$$
$$A \times S_i \to G_i \text{ onto}$$
$$A \times (S_i - \{1\}) \to G_i - A \text{ onto}$$
$$(a, s) \mapsto as \text{ bijection}$$

Let $Y_i =$ set of reduced words of form $(1; s_1 \ldots s_n) = \{(1; s_1 \ldots s_n) | 1 \in A; s_1 \in S_{i_1} \ldots s_n \in S_{i_n}; \mathbf{i} = (i_1 \ldots i_n), i_j \in I \text{ s.t. } i_m \neq i_{m+1} \text{ for } 1 \leq m \leq n-1\}$.

$$A \times Y_i \to X = \coprod_i X_i$$
$$(a, (1; s_1 \ldots s_n)) \mapsto (a; s_1 \ldots s_n)$$
$$A \times \{S_i - \{1\}\} \times Y_i \to X$$
$$((a, s), (1; s_1 \ldots s_n)) \mapsto (a; s, s_1 \ldots s_n)$$

and remember that $X_i =$ set of reduced words of type $\mathbf{i}$.

It's clear that this yields a bijection $A \times Y_i \bigcup A \times (S_i - \{1\}) \times Y_i \to X$.

Let $x \in X$. Then $x \in X_{\mathbf{i}}$ for some $\mathbf{i}$. So x is a reduced word of type $\mathbf{i}$: $x = (a; s_1 \ldots s_n)$. Then clearly $x = (a; s_1 \ldots s_n) \mapsto (a, (1; s_1 \ldots s_n)) \in A \times Y_i$.

$\square$

cf. pp. 13, Sec. 2. Trees, 2.1 Graphs of Serre (1980) [10]

Definition 56 (1. of Serre (1980) [10]). ***graph*** $\Gamma = (X, Y, Y \to X \times X, Y \to Y)$, *where* $\begin{array}{l} \text{set } X = \text{ vert } \Gamma \\ \text{set } Y = \text{ edge } \Gamma \end{array}$

$$Y \to X \times X$$
$$y \mapsto (o(y), t(y))$$
$$Y \to Y$$
$$y \mapsto \overline{y}$$

s.t. $\forall y \in Y$, $\overline{\overline{y}} = y$, $\overline{y} \neq y$, $o(y) = t(\overline{y})$.

vertex $P \in X$ *of* Γ.

(oriented) edge $y \in Y$, $\overline{y} \equiv$ *inverse edge.*

origin of $y := $ *vertex* $o(y) = t(\overline{y})$.

terminus of $y := $ *vertex* $t(y) = o(\overline{y})$.

extremities of $y := \{o(y), t(y)\}$

*If 2 vertices **adjacent**, they're extremities of some edge.*
orientation of graph $\Gamma = Y_+ \subset Y = $ *edge* Γ *s.t.* $Y = Y_+ \coprod \overline{Y}_+$. *It always exists.*
oriented graph defined, up to isomorphism, by giving 2 sets X, Y_+ *and* $Y+ \to X \times X$.
corresponding set of edges is $Y = Y_+ \coprod \overline{Y}_+$ *where* $\overline{Y}_+ \equiv$ *copy of* Y_+

28.0.2. *Realization of a Graph.* cf. Realization of a Graph in Serre (1980) [10].
Let graph Γ, $X = \text{vert}\Gamma$, $Y = \text{edge}\Gamma$.
topological space $T = X \coprod Y \times [0,1]$, where X, Y provided with discrete topology.
Let R be finest equivalence relation on T for which

$$(y,t) \equiv (\overline{y}, 1-t)$$

(56)
$$(y,0) \equiv o(y) \qquad \forall\, y \in Y, \forall\, t \in [0,1]$$
$$(y,1) \equiv t(y)$$

quotient space $\text{real}(\Gamma) = T/R$ is *realization* of graph Γ. (realization is a functor which commutes with direct limits).
Let $n \in \mathbb{Z}^+$. Consider oriented graph of $n+1$ vertices $0, 1, \ldots n$,

Definition 57. *path (of length n) in graph* Γ *is morphism* c *of* Path_n *into* Γ

orientation given by n edges $[i, i+1]$, $0 \le i < n$, $o([i,i+1]) = i$
$$t([i, i+1]) = i+1$$

For $n \ge 1$,
$(y_1 \ldots y_n)$ sequence of edges $y_i = c([i-1, i])$ s.t.
$$t(y_i) = o(y_{i+1}), \qquad 1 \le i < n \text{ determine } c$$

If $P_i = c(i)$,
c is a path from P_0 to P_n, and P_0 and P_n are *extremities of the path c.*
pair of form $(y_i, y_{i+1}) = (y_i, \overline{y}_i)$ in path is **backtracking**.
path (of length $n-2$), from P_0 to P_n given (for $n > 2$) by $(y_1 \ldots y_{i-1}, y_{i+2} \ldots y_n)$
If $\exists$ path from P to Q in Γ, $\exists$ one without backtracking (by induction)
direct limit $\text{Path}_\infty = \varinjlim \text{Path}_n$ provides notion of infinite path.
$\text{Path}_\infty \ni$ infinite sequence $(y_1, y_2, \ldots)$ of edges s.t. $t(y_i) = o(y_{i+1}) \quad \forall\, i \ge 1$.

Definition 58 (connected graph; Def. 3 of Serre (1980) [10])**.** *graph connected if* $\forall$ *2 vertices, 2 vertices are extremities of at least 1 path.*
maximal connected subgraphs (under relation of inclusion) are connected components *of graph.*

28.0.3. *Circuits.* Let $n \in \mathbb{Z}^+$, $n \ge 1$.
Consider

set of vertices $\mathbb{Z}/n\mathbb{Z}$, orientation given by n edges $[i, i+1]$, $(i \in \mathbb{Z}/n\mathbb{Z})$ with $o([i, i+1]) = i$
$$t([i, i+1]) = i+1$$

Definition 59 (circuit; Def. 4 of Serre (1980) [10])**.** *circuit (length n) in graph is subgraph isormorphic to* Circ_n.

i.e. subgraph = path $(y_1 \ldots y_n)$, without backtracking, s.t. $P_i = t(y_i)$, $(1 \le i \le n)$ distinct, s.t. $P_n = o(y_1)$

$n = 1$ case: Circ_1, $\mathbb{Z}/\mathbb{Z} = \{0\}$, 1 edge, $[0,1]$, $0 \in \mathbb{Z}/1\mathbb{Z}$, $o([0,1]) = 0$
$$t([0,1]) = 1$$
Note Circ_1 has automorphism of order 2, which changes its orientation, i.e.
$\exists$ automorphism $\sigma \in \text{Aut}(\text{Circ}_1)$ s.t. $|\sigma| = 2$, i.e. $\sigma^2 = 1$.
loop := circuit of length 1; so loop $\in \overline{\text{Circ}}_1$.

path (y_1), $P_1 = t(y_1) = o(y_1)$.
$n = 2$ case: Circ_2, $\mathbb{Z}/2\mathbb{Z} = \{0,1\}$, 2 edges $[0,1], [1,2]$,

path (y_1, y_2), $(1 \le i \le 2)$, $P_1 = t(y_1)$
$$P_2 = t(y_2) = o(y_1)$$

28.1. **Combinatorial graphs.** Let $(X, S) \equiv$ simplicial complex of dim. ≤ 1, with
$X \equiv$ set
$S \equiv$ set of subsets of X with 1 or 2 elements, containing all the 1-element subsets.
associates with it a graph $\Gamma = (X, \{(P, Q)\})$.
X is its set of vertices.
edges $= \{(P, Q) \in X \times X\}$ s.t. $P \ne Q$, $\{P, Q\} \in S$, with $\overline{(P, Q)} = (Q, P)$
$$o(P, Q) = P$$
$$t(P, Q) = Q$$

In this graph, 2 edges with same origin and same terminus are equal. This is equivalent to (see following Def.)

Definition 60 (combinatorial; Def. 5 of Serre (1980) [10])**.** *graph is combinatorial if it has no circuit of length ≤ 2*

Conversely, it's easy to see that
every combinatorial graph Γ derived (up to isomorphism) by construction above from simplicial complex (X, S), where
$X = \text{vert}\Gamma$
$S = $ set of subset $\{P, Q\}$ of X s.t. P and Q either adjacent or equal.

Part 8. **Tensors, Tensor networks; Singular Value Decomposition, QR decomposition, Density Matrix Renormalization Group (DMRG), Matrix Product states (MPS)**

29. INTRODUCTIONS TO TENSOR NETWORKS

José Barbon (IFT-CSIC, Univ. Autonoma de Madrid) gave the https://youtu.be/nsxgAOAEgbg for the workshop "Black Holes, Quantum Information, Entanglement, and all that," (29 May-1 June, 2017, with the organizing committee of Thibault Damour (IHES), Vasily Pestun (IHES), Eliezer Rabinovici (IHES & Hebrew Univ. of Jerusalem).
In the talk,
cf. 43:13

The church of the doubled Hilbert space. Any thermal box can be obtained by tracing over a second identical copy, if appropriately entangled into a global pure state.

$$\rho_R = \text{Tr}_L \sum_n C_n \Psi_n^L \otimes \Psi_n^R$$

$$(C_n)_{\text{thermal}} = \left[\frac{e^{-\beta E_n}}{\sum_m e^{-\beta E_M}} \right]^{1/2}$$

But!!
If the entanglement basis is taken to be the high-energy band of two "entangled" CFTs ...

$$|TFD\rangle \sim \sum_{E_n} e^{-\beta E_n/2} |E_n\rangle_L \otimes |E_n\rangle_R$$

neglecting the tiny e^{-S} spacings. we can approximate by continuous spectrum of fields in the background of an AdS black hole, to get ...

$$\int_E e^{-\beta E/2} |E\rangle_L \otimes |E\rangle_R$$

The HH state of the bulk fields!

cf. 46:16

SLOGAN: EPR = ER Maldacena-Susskind

Accumulating a density of entanglement of $S \gg 1$ well-separated Bell pairs within a transversal size of order $(GS)^{1/2}$ seems to generate a geometrical bridge of area GS.

cf. 49:26

Parametrizing complexity of entanglement. Pick a tensor decomposition of Hilbert space of dimension $\exp(S)$ into S factors of $O(1)$ dimension.

$$\mathcal{H} = \mathcal{H}_1 \otimes \mathcal{H}_2 \otimes \cdots \otimes \mathcal{H}_S$$

A tensor of S indices gives a generic state.

cf. 50:27

The decomposition of the big tensor in small building blocks gives a notion of "complexity of entanglement"

rather simple entanglement pattern

somewhat more complex entanglement pattern

picture from M von Raamsdonk

cf. 55:10

A list of open questions & problems.

- Need exactly calculable toy models of AdS/CFT along the lines of SYK model
- Give a "renormalized" definition of quantum complexity for continuum CFTs
- Can tensor networks describe bulk gravitons?
- What is the space-time meaning of quantum complexity saturation?
- Can we define approximate local observables for black hole inferiors?
- Are there obstructions related to firewalls and/or fuzzballs?

Workshop introductory overview by José Barbon for the Institut des Hautes Études Scientifiques (IHÉS) gave me the first impetus to understand tensor networks as I sought to also understand the condensates of entanglement pairs within the black hole.

A Google search for introductions to tensor networks that are on arxiv ("Introduction Tensor Network arxiv") yielded Bridgeman and Chubb's course notes (bf. Bridgeman and Chubb (2017) [14]).

29.1. **List of stuff I want to look at/do/study.** I would like to compare/contrast the following:

- Rotman (2010) [11], Ch. 8, but starting from 8.4 Tensor Products, pp. 574
- Jeffrey Lee (2009) [13], Ch. 7 Tensors

Maldacena and Susskind (2013) [19]

Lectures on Gravity and Entanglement. Mark Van Raamsdonk [22]

- Consider as physical system AdS-Schwarzschild black hole
- CFT
  - PFL Lectures on Conformal Field Theory in $D \geq 3$ Dimensions, Rychkov (2016) [20].

Evenbly and Vidal (2011) [21], Tensor network states and geometry

29.2. **Tensor operations; Tensor properties.**

29.2.1. *rank.* r = rank tensor of dim. $d_1 \times \cdots \times d_r$ is element of $\mathbb{C}^{d_1 \times \cdots \times d_r}$

Tensor product

$$(57) \qquad [A \otimes B]_{i_1 \ldots i_r, j_1 \ldots j_s} := A_{i_1 \ldots i_r} \cdot B_{j_1 \ldots j_s}$$

29.2.2. *Trace.* Given tensor A, xth, yth indices have identical dims. $(d_x = d_y)$, partial trace over these 2 dims. is simply joint summation over that index

$$(58) \qquad [\mathrm{Tr}_{x,y}A]_{i_1 \ldots i_{x-1} i_{x+1} \ldots i_{y-1} i_{y+1} \ldots i_r} = \sum_{\alpha=1}^{d_x} A_{i_1 \ldots i_{x-1} \alpha i_{x+1} \ldots i_{y-1} \alpha i_{y+1} \ldots i_r}$$

29.2.3. *Contraction.*

29.2.4. *Group and splitting, Bridgeman and Chubb (2017)* [14]. "Rank is a rather fluid concept in the study of tensor networks." Bridgeman and Chubb (2017) [14].

$\mathbb{C}^{a_1 \times \cdots \times a_n} \simeq \mathbb{C}^{b_1 \times \cdots \times b_m}$ isomorphic as vector spaces if $\prod_i a_i = \prod_i b_i$.

We can "group" or "split" indices to lower or raise rank of given tensor, resp.

Consider contracting 2 arbitrary tensors.

If we group together indices which are and are not involved in contraction,

"It should be noted that not only is this reduction to matrix multiplication pedagogically handy, but this is precisely the manner in which numerical tensor packages perform contraction, allowing them to leverage highly optimised matrix multiplication code." (cf. Bridgeman and Chubb (2017) [14]; check this)

"Owing to freedom in choice of basis, precise details of grouping and splitting aren't unique." (cf. Bridgeman and Chubb (2017) [14]).

1 specific choice of convention:

tensor product basis, defining basis on product space by product of respective bases.

"The canonical use of tensor product bases in quantum information allows for grouping and splitting described above to be - dealt with implicitly."

$$(59) \qquad |0\rangle \otimes |1\rangle \equiv |0\rangle$$

and precisely this grouping,

$$|0\rangle \otimes |1\rangle \in \mathrm{Mat}_{\mathbb{C}}(2,2), \text{ whilst}$$

$$(60) \qquad |01\rangle \in \mathbb{C}^4$$

Suppose rank $n+m$ tensor T, group its first n indices, last m indices together.

$$T_{I,J} := T_{i_1 \ldots i_n, j_1 \ldots j_m}$$

where

$$I := i_1 + d_1^{(i)} i_2 + d_1^{(i)} d_2^{(i)} i_3 + \cdots + d_1^{(i)} \ldots d_{n-1}^{(i)} i_n$$

$$J := j_1 + d_1^{(j)} j_2 + d_1^{(j)} d_2^{(j)} j_3 + \cdots + d_1^{(j)} \ldots d_{m-1}^{(j)} j_m$$

EY : 20170627 to elaborate, consider a functor `flatten` that does what's described above, in the context of category theory (and so this is the generalization):

$$\mathbb{K}^{d_1^{(i)}} \times \mathbb{K}^{d_2^{(i)}} \times \cdots \times \mathbb{K}^{d_n^{(i)}} \times \mathbb{K}^{d_1^{(j)}} \times \mathbb{K}^{d_2^{(j)}} \times \cdots \times \mathbb{K}^{d_m^{(j)}} \xrightarrow{\text{flatten}} \mathbb{K}^{\prod_{p=1}^n d_p^{(i)}} \times \mathbb{K}^{\prod_{q=1}^m d_q^{(j)}}$$

$$T_{i_1 \ldots i_n, j_1 \ldots j_m} \xmapsto{\text{flatten}} T_{I,J}$$

$$(61) \qquad \{0,1,\ldots d_1^{(i)}\} \times \{0,1,\ldots d_2^{(i)}\} \times \cdots \times \{0,1,\ldots d_n^{(i)}\} \times \{0,1,\ldots d_1^{(j)}\} \times \{0,1,\ldots d_2^{(j)}\} \times \cdots \times \{0,1,\ldots d_m^{(j)}\} \xrightarrow{\text{flatten}}$$

$$\xrightarrow{\text{flatten}} \{0,1,\cdots \prod_{p=1}^n d_p^{(i)} - 1\} \times \{0,1,\cdots \prod_{q=1}^m d_q^{(j)} - 1\}$$

$$(i_1, i_2, \ldots i_n, j_1, j_2 \ldots j_m) \xmapsto{\text{flatten}} (I,J) := (i_1 + d_1^{(i)} i_2 + \cdots + d_1^{(i)} \ldots d_{n-1}^{(i)} i_n, j_1 + d_1^{(j)} j_2 + \cdots + d_1^{(j)} \ldots d_{m-1}^{(j)} j_m)$$

It doesn't make sense to call this "row-major" or "column-major" ordering generalization, because we are not dealing with only 2 indices where we can definitely say the first index indexes the "row" and the second index indexes the "column." At most, possibly, you can alternatively have this:

$$(i_1 \dots i_n, j_1 \dots j_m) \xmapsto{\text{flatten}} (I, J) := (d_2^{(i)} \dots d_n^{(i)} i_1 + d_3^{(i)} \dots d_n^{(i)} i_2 + \dots + i_n, d_2^{(j)} \dots d_m^{(j)} j_1 + \dots + j_m)$$

Note that this is all 0-*based counting* (i.e. we start counting from 0 just like in C,C++,Python, etc.). If you really wanted 1-based counting, you'd have to complicate the above formulas as such:

$$(I, J) := (i_1 + d_1^{(i)}(i_2 - 1) + \dots + d_1^{(i)} \dots d_{n-1}^{(i)}(i_n - 1), j_1 + d_1^{(j)}(j_2 - 1) + \dots + d_1^{(j)} \dots d_{m-1}^{(j)}(j_m - 1))$$

Note that formulas are easily checked by pluggin in the minimum and maximum values for the indices and seeing if they make sense (e.g. plug in $(0, 0, \dots, 0)$ for all indices for 0-based counting and make sure you get back $I = 0$ or $J = 0$).

29.3. Singular Value Decomposition.

$$T_{I,J} = \sum_\alpha U_{I,\alpha} S_{\alpha,\alpha} \overline{V}_{J,\alpha}$$

$$\text{Mat}_{\mathbb{K}}(N, M) \xrightarrow{\text{SVD}} \text{Mat}_{\mathbb{K}}(N, P) \times \text{Mat}_{\mathbb{K}}(P, P) \times \text{Mat}_{\mathbb{K}}(M, P)$$

(62)
$$T_{I,J} \xrightarrow{\text{SVD}} U_{I,\alpha}, S_{\alpha,\alpha}, \overline{V}_{I,\alpha} \text{ s.t.}$$

$$T_{I,J} = \sum_\alpha U_{I,\alpha} S_{\alpha,\alpha} \overline{V}_{J,\alpha}$$

$$T = USV^\dagger$$

For the higher-dimensional version of SVD,

$$\mathbb{K}^{d_1^{(i)}} \otimes \dots \otimes \mathbb{K}^{d_N^{(i)}} \otimes \mathbb{K}^{d_1^{(j)}} \otimes \dots \otimes \mathbb{K}^{d_M^{(j)}} \xrightarrow{\text{flatten}} \text{Mat}_{\mathbb{K}}(N, M) \xrightarrow{\text{SVD}} \text{Mat}_{\mathbb{K}}(N, P) \times \text{Mat}_{\mathbb{K}}(P, P) \times \text{Mat}_{\mathbb{K}}(M, P) \xrightarrow{\text{splitting}}$$

(63)
$$\xrightarrow{\text{splitting}} \mathbb{K}^{d_1^{(i)}} \otimes \dots \otimes \mathbb{K}^{d_N^{(i)}} \otimes \mathbb{K}^P \times \text{Mat}_{\mathbb{K}}(P, P) \times \mathbb{K}^{d_1^{(j)}} \otimes \dots \otimes \mathbb{K}^{d_M^{(j)}} \otimes \mathbb{K}^P$$

$$T_{i_1 \dots i_N, j_1 \dots j_M} = \sum_\alpha U_{i_1 \dots i_N, \alpha} S_{\alpha, \alpha} \overline{V}_{j_1 \dots j_M, \alpha}$$

30. Density Matrix Renormalization Group; Matrix Product States (MPS)

cf. Sec. 4, Matrix Product States (MPS) of Schollwöck [16].

Necessarily, given matrix $M \in \text{Mat}_{\mathbb{K}}(M, N)$ (notation in Bridgeman and Chubb (2017) [14] and CUDA Toolkit Documentation; I will follow the notation in Schollwöck [16] since his A,B denote specific physical meaning).

For
$$U \in \text{Mat}_{\mathbb{K}}(N_A, \min(N_A, N_B)) \text{ s.t. } UU^\dagger = 1$$
$$S \in \text{Mat}_{\mathbb{K}}(\min(N_A, N_B), \min(N_A, N_B))$$

s.t. S diagonal with nonnegative $S_{aa} = s_a$, i.e. $S_{ij} = \delta_{ij} s_i$ s.t. $s_i \geq 0 \quad \forall i = 1, 2, \dots \min(N_A, N_B)$.

$r \equiv$ (Schmidt) rank of $M :=$ number of nonzero singular values.
Assume $s_1 \geq s_2 \geq \dots \geq s_r \geq 0$.
$V^\dagger \in \text{Mat}_{\mathbb{K}}(\min(N_A, N_B), N_B)$ s.t. $V^\dagger V = 1$.

$$\text{Mat}_{\mathbb{K}}(N_A, N_B) \xrightarrow{\text{SVD}} U_{\mathbb{K}}(N_A, \min(N_A, N_B)) \times \text{diag}_{\mathbb{K}}(\min(N_A, N_B)) \times U_{\mathbb{K}}(\min(N_A, N_B), N_B)$$

$$M \xmapsto{\hspace{3cm} \text{SVD} \hspace{3cm}} USV^\dagger$$

Optimal approximation of M (rank r by matrix M' (rank $r' < r$) property.
In Frobenius norm $\|M\|_F^2 := \sum_{i,j} |M_{ij}|^2$, induced by inner product $\langle M | N \rangle = \text{tr} M^\dagger N$. Indeed,

$$\text{tr} M^\dagger N = (M^\dagger)_{ik} N_{ki} = \overline{M}_{ki} N_{ki}$$

and so for

(64)
$$M' = US'V^\dagger, \qquad S' = \text{diag}(s_1, s_2 \dots s_{r'}, 0 \dots)$$

cf. Eq. (19) of Schollwöck [16], i.e. 1 sets all but 1st r' singualr values to 0.
Use singular value decomposition (SVD) to derive Schmidt decomposition of general quantum state.
$\forall$ pure state $|\psi\rangle$ on AB,

$$|\psi\rangle = \sum_{i,j} \Psi_{ij} |i\rangle_A |j\rangle_B$$

where $\{|i\rangle_A\}, \{|j\rangle_B\}$ orthonormal bases of A, B ((complex) Hilbert spaces), with dim. N_A, N_B, respectively.
Let $\Psi_{i,j} \in \text{Mat}_{\mathbb{K}}(N_A, N_B)$.
Then **reduced density operators** $\widehat{\rho}_A, \widehat{\rho}_B$ are such that

$$\widehat{\rho}_A = \text{tr}_B |\psi\rangle\langle\psi|$$
$$\widehat{\rho}_B = \text{tr}_A |\psi\rangle\langle\psi|$$

In matrix form,

$$\rho_A = \Psi\Psi^\dagger$$
$$\rho_B = \Psi^\dagger\Psi$$

Indeed,

$$(\rho_A)_{ij} = \Psi_{ik}\overline{\Psi}_{jk}$$
$$(\rho_B)_{ij} = \overline{\Psi}_{ki}\Psi_{kj}$$
$$|\psi\rangle\langle\psi| = \sum_{i,j} \Psi_{ij}|i\rangle_A|j\rangle_B \sum_{l,m} \overline{\Psi}_{lm}\langle l|_A\langle m|_B$$
$$\text{tr}_B |\psi\rangle\langle\psi| = \sum_{i,j} \Psi_{ik}\overline{\Psi}_{jk}|i\rangle_A j|_A$$

In matrix form,

$$\rho_A = \Psi\Psi^\dagger$$
$$\rho_B = \Psi^\dagger\Psi$$

Carry out SVD on Ψ in Eq. (20) of Schollwöck [16],

$$|\psi\rangle = \sum_{i,j} \Psi_{ij}|i\rangle_A|j\rangle_B$$

$$|\psi\rangle = \sum_{ij} \Psi_{ij}|i\rangle_A|j\rangle_B = \sum_{ij} \sum_{a=1}^{\min(N_A,N_B)} U_{ia}S_{aa}\overline{V}_{ja}|i\rangle_A|j\rangle_B = \sum_{a=1}^{\min(N_A,N_B)} \sum_i U_{ia}|i\rangle_A s_a \sum_j \overline{V}_{ja}|j\rangle_B = \sum_{a=1}^{\min(N_A,N_B)} s_a|a\rangle_A|a\rangle_B$$

Due to orthogonality of $U, V^\dagger$, $\{|a\rangle_A\}, \{|a\rangle_B\}$ orthonormal, and can be extended to be orthonormal bases of A, B.

If we restrict the sum to run only over the $r \leq \min(N_A, N_B)$ positive nonzero singular values (i.e., for $\sum_{a=1}^{\min(N_A,N_B)}$, $a > 0$) $\forall a \leq r$, and so

$$|\psi\rangle = \sum_{a=1}^r s_a|a\rangle_A|a\rangle_B$$

$r = 1$ (classical) product states. $|\psi\rangle = s_1|1\rangle_A|1\rangle_B$.
$r > 1$ entangled (quantum) states.
Schmidt decomposition on reduced density operators for A and B:

$$\widehat{\rho}_A = \sum_{a=1}^{r} s_a^2 |a\rangle_A \langle a|_A$$

$$\widehat{\rho}_B = \sum_{a=1}^{r} s_a^2 |a\rangle_B \langle a|_B$$

Respective eigenvectors are left and right singular vectors.

Von Neumann entropy can be read off:

$$S_{A|B}(|\psi\rangle) = -\mathrm{tr}\widehat{\rho}_A \log_2 \widehat{\rho}_A = -\sum_{a=1}^{r} s_a^2 \log_2 s_a^2$$

In view of large size of Hilbert spaces, approximate $|\psi\rangle$ by some $|\widetilde{\psi}\rangle$ spanned over state spaces A, B that have dims. r' only.
Since 2-norm of $|\psi\rangle$,

$$\||\psi\rangle\|_2^2 = \sum_{ij} |\Psi_{ij}|^2 = \|\Psi\|_F^2$$

since

$$\||\psi\rangle\|_2^2 = \sum_{a=1}^{r} s_a^2 = \sum_{ij} |\Psi_{ij}|^2$$

iff $\{|i\rangle\}, \{|j\rangle\}$ orthonormal. Optimal approx. of 2-norm given by optimal approx. of Ψ by $\overline{\Psi}$ in Frobenius norm, where $\overline{\Psi}$ is matrix of rank r'.

$\overline{\Psi} = US'V^{\dagger}$, $S' = \mathrm{diag}(s_1, \ldots s_{r'}, 0 \ldots)$ from above.
$\implies$ Schmidt decomposition of approximate state

$$(65) \qquad |\overline{\Psi}\rangle = \sum_{a=1}^{r'} s_a |a\rangle_A |a\rangle_B$$

cf. Eq. (27) of Schollwöck [16], where s_a must be rescaled if normalization desired.

30.1. QR decomposition. cf. 4.1.2. of Schollwöck [16].

If actual value of singular values not used explicitly, then use *QR decomposition*.

QR decomposition: $\forall M \in \mathrm{Mat}_{\mathbb{K}}(N_A, N_B)$,

$$(66) \qquad M = QR, \ Q \in U_{\mathbb{K}}(N_A), \ \text{i.e.} \ Q^{\dagger}Q = 1 = QQ^{\dagger}, \ R \in \mathrm{Mat}_{\mathbb{K}}(N_A, N_B) \ \text{s.t. upper triangular, i.e. } R_{ij} = 0 \text{ if } i > j$$

thin QR decomposition: assume $N_A > N_B$. Then bottom $N_A - N_B$ rows of R are 0, so

$$M = Q \begin{bmatrix} R_1 \\ 0 \end{bmatrix} = \begin{bmatrix} Q_1 & Q_2 \end{bmatrix} \begin{bmatrix} R_1 \\ 0 \end{bmatrix} = Q_1 R_1$$

$$Q_1 \in \mathrm{Mat}_{\mathbb{K}}(N_A, N_B)$$

$$R_1 \in \mathrm{Mat}_{\mathbb{K}}(N_B, N_B)$$

While $Q_1^{\dagger} Q_1 = 1$ in general $Q_1 Q_1^{\dagger} \neq 1$

31. Matrix Product States (MPS)

cf. Section 4.13 Decomposition of arbitrary quantum states into MPS of Schollwöck [16].

Consider lattice of L sites, d-dim. local state spaces $\{\sigma_i\}_{i=1, \ldots L}$.

Most general pure quantum state on lattice (assume normalized)

$$(67) \qquad |\psi\rangle = \sum_{\sigma_1 \ldots \sigma_L} c_{\sigma_1 \ldots \sigma_L} |\sigma_1 \ldots \sigma_L\rangle$$

cf. Eq. (30) of Schollwöck [16],

31.1. Left-canonical matrix product state. cf. Schollwöck [16],

Consider the process of refactoring or "flattening", which I claim to be a functor *flatten*:

$$|\psi\rangle \in \mathcal{H} \text{ s.t. } \dim \mathcal{H} = d^L \mapsto \Psi \in \mathrm{Mat}_{\mathbb{K}}(d, d^{L-1})$$

$$\Psi_{\sigma_1, (\sigma_2 \ldots \sigma_L)} = c_{\sigma_1 \ldots \sigma_L}$$

$$(68) \qquad \xrightarrow{\mathrm{SVD}} c_{\sigma_1 \ldots \sigma_L} = \Psi_{\sigma_1, (\sigma_2 \ldots \sigma_L)} = \sum_{a}^{r_1} U_{\sigma_1, a_1} S_{a_1, a_1} (V^{\dagger})_{a_1, (\sigma_2 \ldots \sigma_L)} \equiv \sum_{a_1}^{r_1} U_{\sigma_1, a_1} c_{a_1, \sigma_2 \ldots \sigma_L}$$

i.e.

$$(\mathbb{K}^d)^L \to \mathrm{Mat}_{\mathbb{K}}(1, r) \times \mathrm{Mat}_{\mathbb{K}}(r_1 d, d^{L-2})$$

$$c_{\sigma_1 \ldots \sigma_L} \mapsto A_{a_1}^{\sigma_1}, \Psi_{(a_1 \sigma_2), (\sigma_3 \ldots \sigma_L)}$$

s.t.

$$c_{\sigma_1 \ldots \sigma_L} = \sum_{a_1}^{r_1} A_{a_1}^{\sigma_1} \Psi_{(a_1 \sigma_2), (\sigma_3 \ldots \sigma_L)}$$

where rank $r_1 \leq d$.

$$U \in \mathrm{Mat}_{\mathbb{K}}(d, \min(d, r)) = \mathrm{Mat}_{\mathbb{K}}(d, r)$$

Consider d row vectors A^{σ_1}, $A_{a_1}^{\sigma_1} = U_{\sigma_1, a_1}$.

$$c_{a_1 \sigma_2 \ldots \sigma_L} = \sum_{a_1}^{r_1} A_{a_1}^{\sigma_1} \Psi_{(a_1, \sigma_2), (\sigma_3 \ldots \sigma_L)} \text{ with}$$

$$\Psi_{(a_1 \sigma_2), (\sigma_3 \ldots \sigma_L)} \in \mathrm{Mat}_{\mathbb{K}}(r_1 d, d^{L-2})$$

So from Eq. (34) of Schollwöck [16],

$$(69) \qquad c_{\sigma_1 \ldots \sigma_L} = \sum_{a_1}^{r_1} \sum_{a_2}^{r_2} A_{a_1}^{\sigma_1} U_{(a_1 \sigma_2), a_2} S_{a_2, a_2} (V^{\dagger})_{a_2, (\sigma_3 \ldots \sigma_L)} = \sum_{a_1}^{r_1} \sum_{a_2}^{r_2} A_{a_1}^{\sigma_1} A_{a_1, a_2}^{\sigma_2} \Psi_{(a_2 \sigma_3), (\sigma_4 \ldots \sigma_L)}$$

So for

$$U \in \mathrm{Mat}_{\mathbb{K}}(d, r_1 \times r_2) \mapsto \{A^{\sigma_2}\}_{\sigma_2}, \qquad |\{A^{\sigma_2}\}_{\sigma_2}| = d, \qquad A^{\sigma_2} \in \mathrm{Mat}_{\mathbb{K}}(r_1, r_2)$$

$A_{a_1, a_2}^{\sigma_2} = U_{(a_1, \sigma_2), a_2}$ and multiplied S and $V^{\dagger}$,

$$SV^{\dagger} \mapsto \Psi \in \mathrm{Mat}_{\mathbb{K}}(r_2 d, d^{L-3}); \qquad r_2 \leq r_1 d \leq d^2$$

and so continuing the application of SVD and refactoring (what I call applying the *flatten* functor)

$$\xrightarrow{\mathrm{SVD}} c_{\sigma_1 \ldots \sigma_L} = \sum_{a_1 \ldots a_{L-1}} A_{a_1}^{\sigma_1} A_{a_1 a_2}^{\sigma_2} \ldots A_{a_{L-2}, a_{L-1}}^{\sigma_{L-1}} A_{a_L - 1}^{\sigma_L} \equiv A^{\sigma_1} A^{\sigma_2} \ldots A^{\sigma_{L-1}} A^{\sigma_L}$$

31.1.1. *Matrix Product State (definition).*

Definition 61 (Matrix Product State).

(70)
$$|\psi\rangle = \sum_{\sigma_1\ldots\sigma_L} A^{\sigma_1} A^{\sigma_2}\ldots A^{\sigma_{L-1}} A^{\sigma_L} |\sigma_1\ldots\sigma_L\rangle$$

Maximally, the dims. are

$$(1\times d),(d\times d^2)\ldots(d^{L/2-1}\times d^{L/2}),(d^{L/2}\times d^{L/2-1})\ldots(d^2\times d),(d\times 1)$$

Since $\forall$ SVD, $U^\dagger U = 1$,

$$\delta_{a_l,a_l'} = \sum_{a_{l-1}a_l} (U^\dagger)_{a_l,(a_{l-1}\sigma_l)} U_{(a_{l-1}\sigma_l),a_l'} = \sum_{a_{l-1}\sigma_l} (A^{\sigma_l})^\dagger_{a_l,a_{l-1}} A^{\sigma_l}_{a_{l-1},a_l'} = \sum_{\sigma_l}((A^{\sigma_2})^\dagger A^{\sigma_l})_{a_l,a_l'}$$

or

(71)
$$\sum_{\sigma_l}(A^{\sigma_l})^\dagger A^{\sigma_l} = 1$$

cf. Eq. (38) of Schollwöck [16],

If for $\{A^{\sigma_l}\}_{\sigma_l}$, $\sum_{\sigma_l}(A^{\sigma_l})^\dagger A = 1$, $\{A^{\sigma_l}\}_{\sigma_l}$ are **left-normalized**; matrix product states that consist of only left-normalized matrices are **left-canonical**.

View Density Matrix Renormalization Group (DMRG) decomposition of universe into blocks A and B, split lattice into parts A,B, where A compries sites 1 through l and B sites $l+1$ through L.

$$|a_l\rangle_A = \sum_{\sigma_1\ldots\sigma_l} (A^{\sigma_1} A^{\sigma_2}\ldots A^{\sigma_l})_{a_l,1} |\sigma_1\ldots\sigma_l\rangle$$

$$|a_l\rangle_B = \sum_{\sigma_{l+1}\ldots\sigma_L} (A^{\sigma_{l+1}} A^{\sigma_{l+2}}\ldots A^{\sigma_L})_{a_l,1} |\sigma_{l+1}\ldots\sigma_L\rangle$$

s.t. matrix product state (MPS) is

$$|\psi\rangle = \sum_{a_l} |a_l\rangle_A |a_l\rangle_B$$

31.1.2. *Summarize this procedure of constructing, from a pure state, the matrix product state (version) by successive application Singular Value Decomposition (SVD) from the Category Theory point of view.* Consider all applications of SVD to get to a matrix

$$(\mathbb{K}^d)^L \xrightarrow{\text{SVD}} (\mathrm{Mat}_\mathbb{K}(1,r_1))^d \times (\mathrm{Mat}_\mathbb{K}(r_1,r_2))^d \times \cdots \times (\mathrm{Mat}_\mathbb{K}(r_{L-2},r_{L-1}))^d \times (\mathrm{Mat}_\mathbb{K}(r_{L-1},1))^d$$

$$c_{\sigma_1\ldots\sigma_L} \longmapsto^{\text{SVD}} c_{\sigma_1\ldots\sigma_L} = \sum_{a_1\ldots a_{L-1}} A^{\sigma_1}_{a_1} A^{\sigma_2}_{a_1 a_2}\ldots A^{\sigma_{L-1}}_{a_{L-2},a_{L-1}} A^{\sigma_L}_{a_{L-1}}$$

product state (MPS):

and remember the maximal values that the r_i's can take:

$$r_1 \le d \qquad r_{L/2} \le d^{L/2} \qquad r_{L-2} \le d^2$$
$$r_2 \le d^2 \qquad r_{L/2+1} \le d^{L/2-1} \qquad r_{L-1} \le d$$

Let us explicitly note the functors (that were applied) flatten (and its inverse), and the application of SVD, explicitly:

$$(\mathbb{K}^d)^L \xrightarrow{\text{flatten}^{-1}} \mathrm{Mat}_{\mathbb{K}}(d, d^{L-1}) \xrightarrow{\text{SVD}} U_{\mathbb{K}}(d, r_1) \times \mathrm{diag}_{\mathbb{K}}(r_1) \times U_{\mathbb{K}}(r_1, d^{L-1}) \xrightarrow{\cong} (\mathrm{Mat}_{\mathbb{K}}(1, r_1))^d \times \mathrm{Mat}_{\mathbb{K}}(r_1 d, d^{L-2}) \xrightarrow{\text{flatten}} (\mathrm{Mat}_{\mathbb{K}}(1, r_1))^d \times (\mathbb{K}^{r_1}) \times (\mathbb{K}^d)^{L-1}$$

$$c_{\sigma_1 \ldots \sigma_L} \xmapsto{\text{flatten}^{-1}} c_{\sigma_1 \ldots \sigma_L} = \Psi_{\sigma_1, (\sigma_2 \ldots \sigma_L)} \xmapsto{\text{SVD}} \Psi_{\sigma_1, (\sigma_2 \ldots \sigma_L)} = \sum_{a_1}^{r_1} U_{\sigma_1 a_1} S_{a_1, a_1} (V^{\dagger})_{a_1, (\sigma_2 \ldots \sigma_L)} \xmapsto{\cong} c_{a_1 \sigma_2 \ldots \sigma_L} = \sum_{a_1}^{r_1} A_{a_1}^{\sigma_1} \Psi_{(a_1, a_2), (\sigma_3 \ldots \sigma_L)} \xmapsto{\text{flatten}} c_{a_1 \sigma_2 \ldots \sigma_L} = \sum_{a_1}^{r_1} A_{a_1}^{\sigma_1} c_{a_1 \sigma_2 \ldots \sigma_L}$$

with $\cong$ in this case denoting an isomorphism (clearly).

In considering some kind of recursive algorithm, so to repeat some series of steps until a matrix product state is obtained, consider this:

$$(\mathbb{K}^d)^L \longrightarrow (\mathrm{Mat}_{\mathbb{K}}(1, r_1))^d \times \mathbb{K}^{r_1} \times (\mathbb{K}^d)^{L-1}$$

$$c_{\sigma_1 \ldots \sigma_L} \longmapsto c_{\sigma_1 \ldots \sigma_L} = \sum_{a_1}^{r_1} A_{a_1}^{\sigma_1} c_{a_1 \sigma_2 \ldots \sigma_L}$$

So in summary, to obtain matrix product states, starting from a matrix,

$$\mathrm{Mat}_{\mathbb{K}}(d, d^{L-1}) \longrightarrow (\mathrm{Mat}_{\mathbb{K}}(1, r_1))^d \times \mathrm{Mat}_{\mathbb{K}}(r_1 d, d^{L-2}) \longrightarrow \cdots \longrightarrow (\mathrm{Mat}_{\mathbb{K}}(1, r_1))^d \times (\mathrm{Mat}_{\mathbb{K}}(r_1, r_2))^d \times \cdots \times (\mathrm{Mat}_{\mathbb{K}}(r_{n-1}, r_n))^d \times (\mathrm{Mat}_{\mathbb{K}}(r_n d, d^{L-(n+1)}))^d$$

$$\Psi_{\sigma_1, (\sigma_2 \ldots \sigma_L)} \longmapsto \sum_{a_1}^{r_1} A_{a_1}^{\sigma_1} \Psi_{(a_1, \sigma_2), (\sigma_3 \ldots \sigma_L)} \longmapsto \cdots \longmapsto \sum_{a_1, a_2, \ldots a_n}^{r_1, r_2, \ldots r_n} A_{a_1}^{\sigma_1} A_{a_1 a_2}^{\sigma_2} \cdots A_{a_{n-1} a_n}^{\sigma_n} \Psi_{(a_n \sigma_{n+1}), (\sigma_{n+2} \ldots \sigma_L)}$$

(72)

31.2. **Right-canonical matrix product state.** cf. Schollwöck [16],

We can start from right in order to obtain

$$c_{\sigma_1 \ldots \sigma_L} = \Psi_{(\sigma_1 \ldots \sigma_{L-1}), \sigma_L} = \sum_{a_{L-1}} U_{(\sigma_1 \ldots \sigma_{L-1}), a_{L-1}} S_{a_{L-1}, a_{L-1}} (V^{\dagger})_{a_{L-1}, \sigma_L} = \sum_{a_{L-1}} \Psi_{(\sigma_1 \ldots \sigma_{L-2}), (\sigma_{L-1} a_{L-1})} B_{a_{L-1}}^{\sigma_L} =$$

$$= \sum_{a_{L-1}, a_{L-2}} U_{(\sigma_1 \ldots \sigma_{L-2}), a_{L-2}} S_{a_{L-2}, a_{L-2}} (V^{\dagger})_{a_{L-2}, (\sigma_{L-1} a_{L-1})} B_{a_{L-1}}^{\sigma_L} = \sum_{a_{L-2}, a_{L-1}} \Psi_{(\sigma_1 \ldots \sigma_{L-3}), (\sigma_{L-2} a_{L-2})} B_{a_{L-2}, a_{L-1}}^{\sigma_{L-1}} B_{a_{L-1}}^{\sigma_L} = \cdots$$

or consider

$$(\mathbb{K}^d)^L \xrightarrow{\text{flatten}^{-1}} \mathrm{Mat}_{\mathbb{K}}(d^{L-1}, d) \xrightarrow{\text{SVD}} U_{\mathbb{K}}(d^{L-1}, r_{L-1}) \times \mathrm{diag}_{\mathbb{K}}(r_{L-1}) \times U_{\mathbb{K}}(r_{L-1}, d) \xrightarrow{\cong} \mathrm{Mat}_{\mathbb{K}}(d^{L-2}, d r_{L-1}) \times (\mathrm{Mat}_{\mathbb{K}}(r_{L-1}, 1))^d \xrightarrow{\text{SVD}}$$

$$c_{\sigma_1 \ldots \sigma_L} \xmapsto{\text{flatten}^{-1}} c_{\sigma_1 \ldots \sigma_L} = \Psi_{(\sigma_1 \ldots \sigma_{L-1}), \sigma_L} \xmapsto{\text{SVD}} c_{\sigma_1 \ldots \sigma_L} = \sum_{a_{L-1}}^{r_{L-1}} U_{(\sigma_1 \ldots \sigma_{L-1}), a_{L-1}} S_{a_{L-1}, a_{L-1}} (V^{\dagger})_{a_{L-1}, \sigma_L} \xmapsto{\cong}$$

$$\begin{array}{l} U_{(\sigma_1 \ldots \sigma_{L-1}), a_{L-1}} S_{a_{L-1}, a_{L-1}} = \Psi_{(\sigma_1 \ldots \sigma_{L-2}), (\sigma_{L-1} a_{L-1})} \\ (V^{\dagger})_{a_{L-1}, \sigma_L} = B_{a_{L-1}}^{\sigma_L} \\ c_{\sigma_1 \ldots \sigma_L} = \sum_{a_{L-1}} \Psi_{(\sigma_1 \ldots \sigma_{L-2}), (\sigma_{L-1}, a_{L-1})} B_{a_{L-1}}^{\sigma_L} \end{array} \xmapsto{\text{SVD}}$$

$$\xrightarrow{\text{SVD}} U_{\mathbb{K}}(d^{L-2}, r_{L-2}) \times \mathrm{diag}_{\mathbb{K}}(r_{L-2}) \times U_{\mathbb{K}}(r_{L-2}, d r_{L-1}) \times (\mathrm{Mat}_{\mathbb{K}}(r_{L-1}, 1))^d \xrightarrow{\cong} \mathrm{Mat}_{\mathbb{K}}(d^{L-3}, d r_{L-2}) \times (\mathrm{Mat}_{\mathbb{K}}(r_{L-2}, r_{L-1}))^d \times (\mathrm{Mat}_{\mathbb{K}}(r_{L-1}, 1))^d$$

$$\xmapsto{\text{SVD}} c_{\sigma_1 \ldots \sigma_L} = \sum_{a_{L-1}, a_{L-2}} U_{(\sigma_1 \ldots \sigma_{L-2}), a_{L-2}} S_{a_{L-2}, a_{L-2}} (V^{\dagger})_{a_{L-2}, (\sigma_{L-1} a_{L-1})} B_{a_{L-1}}^{\sigma_L} \xmapsto{\cong} \begin{array}{l} U_{(\sigma_1 \ldots \sigma_{L-2}), a_{L-2}} S_{a_{L-2}, a_{L-2}} = \Psi_{(\sigma_1 \ldots \sigma_{L-3}), (\sigma_{L-2} a_{L-2})} \\ (V^{\dagger})_{a_{L-2}, (\sigma_{L-1} a_{L-1})} = B_{a_{L-2} a_{L-1}}^{\sigma_{L-1}} \\ c_{\sigma_1 \ldots \sigma_L} = \sum_{a_{L-1}, a_{L-2}} \Psi_{(\sigma_1 \ldots \sigma_{L-3}), (\sigma_{L-2}, a_{L-2})} B_{a_{L-2}, a_{L-1}}^{\sigma_{L-1}} B_{a_{L-1}}^{\sigma_L} \end{array}$$

with $\cong$ in this case denoting an isomorphism (clearly).

And so we can explicitly state the recursion step, for the purpose of writing numerical implementations/algorithms: $\forall l = 1, 2 \ldots L$,

$$\mathrm{Mat}_{\mathbb{K}}(d^{L-l}, dr_{L-(l-1)}) \longrightarrow \mathrm{Mat}_{\mathbb{K}}(d^{L-(l+1)}, dr_{L-l}) \times (\mathrm{Mat}_{\mathbb{K}}(r_{L-l}, r_{L-(l-1)}))^d$$

$$\Psi_{(\sigma_1 \ldots \sigma_{L-l}), (\sigma_{L-(l-1)} a_{L-(l-1)})} \longmapsto \Psi_{(\sigma_1 \ldots \sigma_{L-l}), (\sigma_{L-(l-1)} a_{L-(l-1)})} = \sum_{a_{L-l}} \Psi_{(\sigma_1 \ldots \sigma_{L-(l+1)}), (\sigma_{L-l} a_{L-l})} B^{\sigma_{L-(l-1)}}_{a_{L-l}, a_{L-(l-1)}}$$

and we finally obtained, after successive applications SVD, the matrix product state:

$$(\mathbb{K}^d)^L \longrightarrow \mathrm{Mat}_{\mathbb{K}}(d^{L-1}, d) \longrightarrow (\mathrm{Mat}_{\mathbb{K}}(1, r_1))^d \times (\mathrm{Mat}_{\mathbb{K}}(r_1, r_2))^d \times \cdots \times (\mathrm{Mat}_{\mathbb{K}}(r_{L-2}, r_{L-1}))^d \times (\mathrm{Mat}_{\mathbb{K}}(r_{L-1}, 1))^d$$

$$c_{\sigma_1 \ldots \sigma_L} \longmapsto \Psi_{(\sigma_1 \ldots \sigma_{L-1}), \sigma_L} \longmapsto c_{\sigma_1 \ldots \sigma_L} = \sum_{a_1 \ldots a_{L-1}} B^{\sigma_1}_{a_1} B^{\sigma_2}_{a_1 a_2} \ldots B^{\sigma_{L-1}}_{a_{L-2} a_{L-1}} B^{\sigma_L}_{a_{L-1}}$$

Since

(73)
$$V^{\dagger} V = 1$$

, then

(74)
$$\delta_{a_l a_l'} = \sum_{\sigma_m a_m} (V^{\dagger})_{a_l (\sigma_m a_m)} V_{(\sigma_m a_m) a_l'} = \sum_{\sigma_m a_m} B^{\sigma_m}_{a_l a_m} \overline{B}^{\sigma_m}_{a_l' a_m} \implies \sum_{\sigma_m} \boxed{B^{\sigma_m}(B^{\sigma_m})^{\dagger} = 1}$$

The B-matrices that obey this condition are referred to as **right-normalized** matrices. A matrix product state (MPS) entirely consisting of a product of these right-normalized matrices is called **right-canonical**.

31.2.1. *Numerical implementation; both in BLAS and cuBLAS.* As stated in the CUDA Toolkit Documentation v8.0 for cuSOLVER, under section 5.3.6. `cusolverDn<t>gesvd()` and Remark 1, `gesvd` "only supports" `m>=n`, for matrix you want to decompose $A \in \mathrm{Mat}_{\mathbb{K}}(m, n)$. So number of rows must be greater than or equal to number of columns. And so we can only consider right-normalized matrices in a practical implementation.

I suspect it's the same in BLAS.

Consider the very first step, $l = 1$, in a procedure to calculate the matrix product state.

$$\mathrm{Mat}_{\mathbb{K}}(d^{L-1}, d) \xrightarrow{\text{SVD}} U_{\mathbb{K}}(d^{L-1}, r_{L-1}) \times \mathrm{diag}_{\mathbb{K}}(r_{L-1}) \times U_{\mathbb{K}}(r_{L-1}, d) \xrightarrow{\cong} \mathrm{Mat}_{\mathbb{K}}(d^{L-2}, dr_{L-1}) \times (\mathrm{Mat}_{\mathbb{K}}(r_{L-1}, 1))^d$$

$$\Psi_{(\sigma_1 \ldots \sigma_{L-1}), \sigma_L} \xrightarrow{\text{SVD}} = \sum_{a_{L-1}}^{r_{L-1}} U_{(\sigma_1 \ldots \sigma_{L-1}), a_{L-1}} S_{a_{L-1}, a_{L-1}} (V^{\dagger})_{a_{L-1}, \sigma_L} \xrightarrow{\cong} \begin{array}{l} U_{(\sigma_1 \ldots \sigma_{L-1}), a_{L-1}} S_{a_{L-1}, a_{L-1}} = \Psi_{(\sigma_1 \ldots \sigma_{L-2}), (\sigma_{L-1} a_{L-1})} \\ (V^{\dagger})_{a_{L-1}, \sigma_L} = B^{\sigma_L}_{a_{L-1}} \end{array}$$

with $\cong$ in this case denoting an isomorphism, the *reshaping* of a matrix into different matrix size dimensions, which should be the inverse of a "flatten" functor, which I'll denote as flatten^{-1} as well (and this is this same isomorphism we're talking about).

Let's deal with the specific procedure of flatten^{-1}, how it reshapes indices in accordance with different matrix size dimensions, and with the so-called "stride" when going from, say, 2-dimensional indices to a "flattened" 1-dimensional index.

Note also as a practical numerical implementation design point, LAPACK's linear algebra BLAS library package and CUBLAS assumes *column*-major ordering.

Consider $i = 1, 2, \ldots L - 1$ (for site i) (or for 0-based counting, starting to count from 0, $i = 0, 1, \ldots L - 2$; be aware of this difference as in practical numerical implementation, in C, C++, Python, it assumes 0-based counting).

For a state space of dimension d, we can consider the specific example of $d = 2$, representing say a spin-1/2 system. Then index σ_i can be 0 or 1: $\sigma_i \in \{0, 1\}$. In general, $\sigma_i \in \{0, 1, \ldots d - 1\}$. I may use d or 2 in the context of the number of states (basis vectors) of the spin system (state vector space).

Consider site i. Suppose the spin system there interacts most with sites $i - 1$, $i + 1$, and then next sites $i - 2$, $i + 2$, etc. So the values at $\sigma_{i-1}, \sigma_{i+1}$, etc. are most important in calculating interactions with spin system at site i.

Then we seek this reshaping of the matrix index - assuming 0-based counting/ordering, for $l = 1$:

$$\{0, 1\}^{L-1} \xrightarrow{(\text{flatten})^{-1}} \{0, 1, \ldots 2^{L-1} - 1\}$$

$$(\sigma_0, \sigma_1, \ldots \sigma_{L-2}) \xmapsto{(\text{flatten})^{-1}} I_{L-1} := \sigma_0 + 2\sigma_1 + \cdots + 2^i \sigma_i + \cdots + 2^{L-2} \sigma_{L-2} = \sum_{i=0}^{L-2} 2^i \sigma_i$$

In this way, states of a site i are closest in memory addresses in the allocation of a 1-dim. array, on CPU or GPU memory, so that memory access operations should be efficient.

Assuming SVD doesn't change the striding, and defining the result of matrix multiplication:

$$U_{(\sigma_0, \sigma_1 \ldots \sigma_{L-2}), a_{L-1}} S_{a_{L-1}, a_{L-1}} =: (US)_{(\sigma_0 \ldots \sigma_{L-2}), a_{L-1}} \in \mathrm{Mat}_{\mathbb{K}}(d^{L-1}, r_{L-1})$$

We can reshape (i.e. (flatten)$^{-1}$) in such a manner:

$$\mathrm{Mat}_{\mathbb{K}}(d^{L-1}, r_{L-1}) \xrightarrow{(\text{flatten})^{-1}} \mathrm{Mat}_{\mathbb{K}}(d^{L-2}, dr_{L-1})$$

$$(US)_{(\sigma_0 \ldots \sigma_{L-2}), a_{L-1}} \longmapsto \Psi_{(\sigma_0, \sigma_1, \ldots \sigma_{L-3}), (\sigma_{L-2} a_{L-1})}$$

$$\{0, 1, \ldots 2^{L-1} - 1\} \times \{0, 1, \ldots r_{L-1} - 1\} \xrightarrow{(\text{flatten})^{-1}} \{0, 1, \ldots 2^{L-2} - 1\} \times \{0, 1, \ldots dr_{L-1} - 1\}$$

$$I_{L-1}, a_{L-1} \longmapsto I_{L-1} \mod 2^{L-2}, \frac{I_{L-1}}{2^{L-2}} + da_{L-1}$$

ERNEST YEUNG ERNESTYALUMNI@GMAIL.COM

Reshaping $V^\dagger$ at iteration $l = 1$ can be done as follows:

$$U_{\mathbb{K}}(r_{L-1}, d) \xrightarrow{\text{(flatten)}^{-1}} (\text{Mat}_{\mathbb{K}}(r_{L-1}, 1))^d$$

$$(V^\dagger)_{a_{L-1}, \sigma_{L-1}} \xmapsto{\text{(flatten)}^{-1}} (V^\dagger)_{a_{L-1}, \sigma_{L-1}} = B_{a_{L-1}}^{\sigma_{L-1}}$$

$$\{0, 1, \ldots r_{L-1} - 1\} \times \{0, 1, \ldots d - 1\} \xrightarrow{\text{(flatten)}^{-1}} (\{0, 1, \ldots r_{L-1} - 1\})^d$$

$$a_{L-1}, \sigma_{L-1} \xmapsto{\text{(flatten)}^{-1}} a_{L-1}$$

Let's do this same procedure, reshaping or (flatten)^{-1}, for a general l iteration.

$$\text{Mat}_{\mathbb{K}}(d^{L-l}, r_{L-l}) \xrightarrow{\text{(flatten)}^{-1}} \text{Mat}_{\mathbb{K}}(d^{L-(l+1)}, dr_{L-l})$$

$$(US)_{(\sigma_0 \ldots \sigma_{L-(l+1)}), a_{L-l}} \xmapsto{\text{(flatten)}^{-1}} \Psi_{(\sigma_0, \sigma_1, \ldots \sigma_{L-(l+2)}), (\sigma_{L-(l+1)} a_{L-l})}$$

$$\{0, 1, \ldots d^{L-l} - 1\} \times \{0, 1, \ldots r_{L-l} - 1\} \xrightarrow{\text{(flatten)}^{-1}} \{0, 1, \ldots d^{L-(l+1)} - 1\} \times \{0, 1, \ldots dr_{L-l} - 1\}$$

$$I_{L-l}, a_{L-l} \xmapsto{\text{(flatten)}^{-1}} I_{L-l} \mod d^{L-(l+1)}, \frac{I_{L-l}}{d^{L-(l+1)}} + da_{L-l}$$

$$U_{\mathbb{K}}(r_{L-l}, dr_{L-(l-1)}) \xrightarrow{\text{(flatten)}^{-1}} (\text{Mat}_{\mathbb{K}}(r_{L-l}, r_{L-(l-1)}))^d$$

$$(V^\dagger)_{a_{L-l}, (\sigma_{L-l} a_{L-(l-1)})} \xmapsto{\text{(flatten)}^{-1}} (V^\dagger)_{a_{L-l}, (\sigma_{L-l} a_{L-(l-1)})} = B_{a_{L-l}, a_{L-(l-1)}}^{\sigma_{L-l}}$$

$$\{0, 1, \ldots r_{L-l} - 1\} \times \{0, 1, \ldots dr_{L-(l-1)} - 1\} \xrightarrow{\text{(flatten)}^{-1}} (\{0, 1, \ldots r_L - 1\} \times \{0, 1, \ldots r_{L-(l-1)} - 1\})^d$$

$$a_{L-l}, (\sigma_{L-l} a_{L-(l-1)}) := a_{L-l}, \sigma_{L-1} + da_{L-(l-1)} \xmapsto{\text{(flatten)}^{-1}} a_{L-l}, \frac{(\sigma_{L-1} a_{L-(l-1)})}{d} \, ; \, \sigma_{L-l} = (\sigma_{L-l} a_{L-(l-1)}) \mod d$$
